READY for BUSINESS

We've got it all together—the cost effectiveness and reliability of our 6800 computer system with a high capacity 1.2 megabyte floppy disk system. . . PLUS—an outstanding new DOS and file management system.

1 MEGABYTE DISK SYSTEM

DMAF1 introduces a new level of capability to small computer systems. This disk system features two standard size floppy disk drives using the new double sided disk and two heads per drive. Usable storage space of over 600 kilobytes per drive, giving a total of over 1.0 megabyte of storage on line at all times. Ideal for small business applications, or for personal "super" systems.

DMA CONTROLLER

The controller occupies one main memory slot in an SS-50 bus and uses the Motorola MC-6844 DMA controller. The combination of a DMA

type controller and double sided disks give the system speed of data transfer unobtainable with smaller drives.

OPERATING SYSTEM

To compliment this outstanding hardware we are supplying equally superior software. The disk operating system and file management system is called FLEX. It is one of the most flexible and complete DOS's available for small systems, but just as important; it is easy to use. No one can match the variety of compatible peripherals offered by Southwest Technical Products for the SS-50 bus and the 6800 computer system. Now more than ever there is no reason to settle for less.

DMAF1 Disk System (assembled)	\$2,095.00
DMAF1 Disk System (kit).	\$2,000.00
68/2 Computer with 40K of memory (assembled)	\$1,195.00

SAN ANTONIO, TEXAS 78216

honestly: how many reasons do you need to make sure your next micro- processor is the original, genuine KIM™?

1. KIM 1 is reliable. More KIMs are in use than any other microprocessor board . . . by thousands. KIM is tried and tested.

2. KIM 1 is complete. 1K RAM □ 2K ROM □ Audio cassette and serial interfaces □ 15 bi-directional TTL lines □ 23 key pad □ 6 digit LED display . . . All on one assembled board.

3. KIM 1 is versatile. Generate fixed or variable time delays under program control with the two built-in interval timers □ Each pin of the 15 lines can be used for input or output □ Add a TTY with just four wires □ The key pad can be mounted externally.

4. KIM 1 is built with intelligence. High and low level outputs are provided to interface with any type of cassette recorder □ The interface will ignore voice data between segments of digital data □ Check-sums or punched tape are automatically verified when data is reloaded □ The software has automatic data rate detection (from 110 to 1200 baud) □ Programs are debugged with Single Step feature on the key pad □ Key pad and display subroutines in the ROM monitor are completely accessible.

5. KIM 1 is expandable. KIM 4 motherboard and KIM 3B memory board allow up to 65K bytes of memory □ All required address and data busses and control signals are available options of the KIM 1 connectors □ Each I/O port is addressed as a normal memory location.

6. KIM 1's instruction set is comprehensive. The MOS 6502 architecture has no I/O register or instructions; any memory location can become a port □ Each I/O line can be separately programmed with a single status word into the correct memory location.

7. KIM 1's documentation is the best. Anywhere. 100 page User's Manual □ 250 page programming manual □ 175 page hardware manual □ Pocket reference card □ Wall-sized schematic. All included in the package.

8. KIM 1 is guaranteed. Not just for parts; the entire board for 90 days. At no charge.

9. KIM 1 is value. More features. More power. For much less. **Just \$245.00** in quantities of one. Quantity prices are available.

10. KIM 1 is now (almost) ready for immediate delivery!

And soon — very soon — we'll be able to ship immediately. Yes, you may have been waiting; KIM has been on back order since it was introduced two years ago. And sales have increased as fast as production.

But now we're pulling out all stops. MOS Technology is now a Commodore company. And Commodore knows how to produce quantity without sacrificing quality.

This is the KIM 1™

Important: Inquiries from a select number of dealers will now be considered!

PUBLISHER'S REMARKS

Wayne Green

The French Do It Again

A letter from W3NET included a reference from a navy-published book, and it covers the history of Teletype codes. The upshot of all this is that the five-level code we've been using all these years is not Baudot at all . . . it is the Murray code, developed by Donald Murray around 1901. The Baudot code is entirely different . . . though still a five-unit code. For instance, in case you don't want to believe me, the letter R in Murray is 2 & 4. In Baudot, R is 3. In Murray code, the uppercase R is the number 4. In Baudot, uppercase R is a hyphen. Convinced? Murray code is also known as the International Telegraph Alphabet No. 2.

It's time to change to ASCII and bury this whole mess.

Spadework

There it was! Right by the ramp leading to the United Airlines plane at Logan (Boston) I saw this kiosk with a PolyMorphic microcomputer . . . all set up and running. It was put there by the Computer Shop of Cambridge and must have cost a bundle. I hope it draws some business for them.

Just to be sure, I called Bob Rivers at the Computer Shop and asked him how effective the kiosk was. That's awfully expensive

advertising, so it would have to pull a lot of customers to be worth the expense. Bob said that they had renewed their contract for the space, if that told me anything. It sure did.

When we were pricing displays for promoting Computermania, we checked on the cost of the billboards at the airport . . . hoot mon! They cost a couple hundred dollars a month each . . . just for the billboards . . . so I'm afraid to even speculate what a kiosk like that runs.

It's located where every passenger has to go right past it, so the visibility is high. There are some brochures available to help people remember the name and address of the store . . . and a rough outline of what they are selling. This is tremendous promotion for microcomputing.

The airline magazines are running a special computer section in June, so keep your eyes open if you are traveling to NCC or the Atlanta Hamfest/Computerfest.

The Second Faire

The San Jose Computer Faire was enjoyed by just about everyone. It was packed with people and there were many more prospective exhibitors than space for exhibits.

Many exhibitors mentioned that there seemed to be a lot less room than there had been last year at San Francisco . . . room for fewer exhibits . . . and tiny aisles which quickly filled up, making it very difficult to get around.

A check with a Convention Facilities Directory showed us that San Francisco had 37,000 square feet in the main room and 30,000 more in the two side rooms, for a total of 67,000 square feet. The San Jose hall had only 30,000 square feet . . . plus about 2000 more for the micro-booths in a separate room. No wonder it seemed so crowded . . . it was half the size of the San Francisco Civic Auditorium.

A rough calculation of the aisle space showed about 11,000

square feet. When a density of one person per ten square feet is reached, an exhibit hall is generally considered full, and it is difficult for people to move around. This leaves room for elbows and a bag of literature, but not much more. At times the show reached this density in the more popular spots, indicating a possible head count of 1100 in the aisles.

That may seem a bit scant in view of the interesting numbers announced by the Chairwhat-ever, but I like to check little nit-picking items like this, so every so often I would take a quick run down a few aisles, counting the feet and dividing by two. There were seven aisles in all, with four of them shortened by the cut-off corners of the hall. This shortening just about made up for the space in the three cross aisles. My counts confirmed the approximately 1000 attendance figure during the more crowded times.

When the crowd density gets to five square feet per person, there is no longer room for elbows or much arm movement, and shuffling around is quite difficult; and this could account for a total of up to 2200 people in the exhibit aisles.

With 150 exhibits to see and a total of 1500 minutes of show time, maximum, no one could spend more than an average of ten minutes per booth and see the whole show. The attendance was scant on both Friday and Sunday mornings, so very few people managed to get in the entire 1500 minutes. The familiarity of the faces by Sunday indicated that a lot of people did come all three days and made an effort to see all of the exhibits.

Each person who got anywhere near the *Kilobaud* booth was asked to fill out a questionnaire which would be entered in a drawing for a Caribbean cruise. Few passed up the opportunity. By Sunday we found that most of the passersby had already filled in a card, indicating a high percentage of show-goers coming back for a second and third day to see the exhibits.

Though it's possible that a few people managed to see the show and not get near the *Kilobaud* booth, this is unlikely. Our count on the filled-out cards, after sorting out the duplicates (some people try to increase the odds on these things), came to 4100.

A check with several exhibitors who were handing out literature indicated that some had handed out over 3000 pieces . . . others claimed close to 5000.

Software Needed

I don't think there was one manufacturer or dealer who didn't express the universal cry for programs. Hobbyists have been spending a lot of money on hardware, but so far there has been very little they could do with their expensive systems except play *Star Trek*, *Submarine*, *Mastermind* and so forth.

The *Kilobaud* plan for distributing software was enthusiastically embraced by everyone . . . now all we have to do is get it going. We do have the staff and the equipment to get this project running, so I hope the first programs will be coming out in the next few months. Programs for the TRS-80 and PET will be out on cassettes. We have a first-rate lab for checking out programs, a superb cassette duplication system for bulk production of cassettes, the publishing facilities for printing documentation, the sales force and list of dealers to distribute and an international rep organization to get us into every country.

Programmers can do a lot worse than get in touch with *Kilobaud* about publication and distribution of their programs. They must be complete and ready to go, with thorough documentation. The deal is simple: 20 percent royalty on our receipts. This is about five times the going rate, and we hope that we can establish this as a norm for this field by starting it out that way and maintaining this percentage.

What kind of programs are needed? Just about anything for the TRS-80 can be instantly distributed. At present the programs should fit the 4K systems, but it won't be long before we'll be needing most programs to work with the 16K systems. Almost anything will go for the PET too . . . 8K systems.

In the long run we will be able to do best for programmers who work on what we call vertical systems. These would be program packages that would enable computer stores to sell complete systems to specific businesses. Let's say a programmer has a good friend who runs a moving-van service. I picked that at random by opening the Yellow Pages. He would then consult with his moving friend and develop a program package that would do everything a moving-van firm could want . . . everything.

Once the package was done and carefully checked with a couple local van firms for accuracy and completeness, we would

package it and sell it through computer stores. Stores would take the package, set it up to work on a system and then call van firms to come in and see it at work. It is unlikely that many would pass up the system. When you consider that there are over 80,000 such firms around the country, you can see that sales could be vigorous.

There are hundreds of vertical packages that can be developed to help computer stores with their sales . . . and these should bring in handsome royalties.

Next we come to computer-aided instruction . . . and the possibilities for thousands of more programs. Every course taught in school—and those that should be taught in school—are good prospects for this field.

Home-oriented programs will be popular . . . security programs, general business programs, games . . . the list is, fortunately, endless.

Programs that are usable on more than one system will be checked out on other systems in the *Kilobaud* labs . . . we have most of the microcomputer systems set up for this . . . and even our maintenance man is into working up programs. Of course we have the TRS-80 (16K), the PET, Altairs, Imsai, OSI, ISC, Heath H8 and H11, etc. This place is microcomputer heaven.

Programmers should send in complete listings, documentation, some data on how to use the programs and what they can do . . . plus a cassette or disk with the program on it, depending on the system. We would like to get as good a print of the program as possible.

Programmers interested in tackling a major programming package would do well to register with us. This could prevent ten programmers from working up very similar dental programs, for example. Tell us what you are planning to put together and we'll let you know if anyone else is working on something similar. Packages will be chosen on the basis of excellence, not first come.

Very Rich Programmers

We feel it is in the interests of the whole industry that programmers get a major piece of the action. The ability to sell micro-computer systems rests on the excellence of the programs . . . more so than the hardware . . . so why not make it possible for programmers to benefit accord-

ingly? Our system should make it possible for programmers to get rich beyond their wildest dreams.

Suppose we come up with a hot moving-van package . . . and sell it for \$995 to the customer. This would wholesale to the dealer for \$597 (40 percent off). The rep would get 10 percent, leaving a net sale of \$537.30. Twenty percent of that would come to \$107.46. If only 10 percent of the van firms bought the system, this would net the programmer \$859,680 (before taxes). I suspect that sales will be more like 75 percent of the industry than 10 percent, but why build the pie factory in the sky? A 75 percent sale would bring in about \$6.5 million in royalties.

Is \$995 a little high for such a package? The customer would be buying about \$15,000 or so in hardware to go along with it, so it would really be miniscule . . . running less than \$25 a month!

What about my plan for \$7.95 software? Oh, we'll have a lot of that. The programs for games, for homes, general programs, teaching programs, these will be of interest to much wider interest groups, and we can look for sales in the millions of these programs. Most of the TRS-80 and PET programs will come in this category . . . at least until the hardware is available for business use of these systems.

Are you still reading and not rushing to your computer to program? You need some All-Bran . . . badly.

The Kilobaud Lab

As soon as the TRS-80 and PET are brought into the system we'll have one of the most extensive microcomputing systems

Reader Responsibility

One of your responsibilities, as a reader of *Kilobaud*, is to aid and abet the increasing of circulation and advertising, both of which will bring you the same benefit: a larger and even better magazine. You can help by encouraging your friends to subscribe to *Kilobaud*. Remember that subscriptions are guaranteed—money back if not delighted, so no one can lose. You can also help by tearing out one of the cards just inside the back cover and circling the replies you'd like to see: catalogs, spec sheets, etc. Advertisers put a lot of trust in these reader requests for information. To make it even more worth your while to send in the card, a drawing will be held each month and the winner will get a lifetime subscription to *Kilobaud*!

Reader-service card submission is on the increase, so we had plenty to draw from. Winner of a lifetime subscription to *Kilobaud* is Fred Schild of Playa Del Rey CA. Congratulations, Fred.

anywhere. On line at present are two Altairs, an Imsai, an Ohio Scientific Challenger, a Heath H8, an H11 and five Compu-colors. Peripherals on line are a Centronics 51 printer, a G.E. Terminet, a Teletype, an OSI disk, two Altair disks, a North Star disk, the H10 and H9, the SWTP CT-64, a Computalker, a clock module, the Heuristics board, an S.D. Sales Z-80 etc.

Barry, our tech, is working to I/O all of this to our Prime mini-computer system as well as the TRS-80 and PET. This will enable us to check out submitted programs on just about everything popularly available . . . lacking only a 6800 system.

In addition to our wanting to know personally how all the various systems work, another reason for all this hardware is to give us the ability to produce programs for sale . . . and be sure they all work on the systems we say they will.

What's Coming?

Initially we'll be putting out programs on cassettes. After that we'll probably be using more and more disks, then perhaps ROMs; but what will be next?

With the prices on video recording systems coming down, we may soon see video recorders used for program and data storage. These recorders are all set up to be easily controlled by a computer.

Picture, if you will, a study course of the future . . . on videotape. It will have full television action and sound in color . . . and program your computer as it goes along. It will show material and then stop and ask a question about what has been

This is the latest Extensys system. It is approaching the top end in performance microcomputers . . . and it isn't cheap, either. This is an excellent example of how far things have gone with micros.

Here's a view of the main part of the PET production department. The front line is brand new PETs that are being checked out with diagnostic programs to make sure they work.

shown. If your answer is right it will compliment you and then go on with more instructions. If you goof, the tape will rewind and replay the part you screwed up.

How far in the future is all this? Jolt had just such a system up and running two years ago . . . using a Sony video system and Jolt microcomputer. Prices on video recorder systems are coming down; performance and availability are going up. These would seem ideal mates to our computer systems. And think of the data storage on a video cassette!

Jolt was recently bought out by MOS Technology (Commodore), so we may see some of this technology coming along sooner than we think . . . if Commodore lets the Jolt crew have a free hand.

Speaking of the PET

After the Faire, Sherry and I stayed over a couple of days in the San Jose area. We made a visit to Extensys and then went over to Commodore to see the

plant where the PET is being produced. Commodore doesn't want me to spill the beans on how many units they are turning out, but I'm sure you will be able to get a good idea from my photos. They have a big bunch of units going through the production line and then through exhaustive testing. The PETs are burned in for 48 hours at a very high temperature in order to bring on any possible failures before shipment rather than after. The small number of sets in for repairs indicates the quality control system is working very well.

How long does it take to put together a PET? From one end of the production line to the test bench it takes a little over one hour! With the large number of PETs coming out of the factory it is amazing that dealers are groaning over their back orders . . . some were telling us they could sell ten times as many as they are able to get.

The factory will be increasing its production soon, but this still won't take the pressure off. By next year, I'll bet they have a factory several times as large as they have right now.

What about Radio Shack?

On the way back from San Jose we stopped off in Dallas/Fort Worth.

The next day we had lunch with Bill Mueller of ICOM and Art Housholder of AGL Electronics in Dallas. A Mexican restaurant right near AGL was fantastic. I don't care if AGL wants to throw away their advertising money like drunken sailors in other magazines, I'll be stopping by to visit at every opportunity.

From there we waddled on to Radio Shack and Hy Siegel. Despite a broken leg, gained a

On the right of the PETs being checked out is rack upon rack of PETs being burned in. They burn 'em in for 48 hours before packing them up for shipment. Normally they have those plastic covers over the burn-in racks to make sure that the PETs are hot, thus aggravating any troubles that might otherwise turn up later.

few weeks earlier on the ice-skating rink in the center of the Tandy building shopping plaza, Hy took us all over the new Tandy headquarters building.

A few blocks away there is an enormous parking lot, serviced by a new subway system that ends in the Tandy building. This permits people to park and shop the

downtown area . . . and get to the parking lot easily. The ground floor ice-skating rink is ringed by a shopping plaza. Prominent in the plaza were a giant Radio Shack store, a Tandy Computer store and a new Tandy Telephone store.

The elevators go up to the 17th floor; from there you have to take an escalator to the top corporate offices.

While some firms are being run by uptight people who appear to be well on their way to terminal constipation, the Radio Shack crowd seems to be having a good time at their work. I was surprised at the large number of hams involved in the higher positions . . . most of whom have been reading 73 for years. I like that in a person. I've known many of the people either through Radio Shack in Boston or Allied Radio. Quite a crew!

Tandy has built two tower buildings recently . . . both about 19 floors. They have a third tower going up soon . . . 45 floors. Tandy is dominating downtown Fort Worth. Some difference from when I lived in the area about 30 years earlier and the highest point in town was the dung heap at the stockyards.

After the visit to the offices . . . some talking with various departments about prospective microcomputer growth . . . my software plans, etc., Hy took us off to the plant not far away where the TRS-80s are being made. Wow! Again, no production figures were to be let out of the bag, but you can see from my pictures that the production is not insignificant. They run the systems in for 24 hours, so you know all the sets you can see are just a part of one day's production.

It was so difficult to tear myself

Here are over 100 TRS-80s being burned in . . . and this is just one part of the burn-in area . . . which goes on and on . . . and on. If anyone tries to tell you Radio Shack isn't making a lot of 80s in Ft. Worth, tell him baloney.

away from the factory that we almost missed our plane back to Boston . . . and home.

TRS-80—Is It Any Good?

I've had letters from hundreds of TRS-80 owners . . . and talked with dozens at the recent shows, but I haven't had any negative comments yet on the system. Oh, everyone wants more memory and bigger BASIC, but they are amazed at what the 80 can do with what it has—and they are having a ball with it.

In view of this, the recent blast in PCC at the 80 is a mystery. The people at Radio Shack were numbed by the negative review . . . and as bewildered as I by it. Yes, the case for the keyboard and CPU is plastic, but it is very attractive and it resists dings a lot better than metal; and if you want to carry the system around the way most of us do, you loudly hail the use of lightweight plastic instead of boat-anchor iron. I carried my TRS-80 with me to San Jose . . . on to Dallas and back home. I sure wouldn't have done that if it had been in a metal case. What other computer system can you throw in a suitcase and take with you?

Byting the Apple

Since they were giving out free copies of *Byte* at San Jose, I stuck a copy in my flight bag to bring back. The price was just right.

On the flight, I had the choice of sitting back and resting or reading the magazine. I made the wrong choice and soon got a mental hernia over a review of the Apple II by editor Helmers.

Before reading the Helmers view of the Apple, I had the impression that it was an excellent system. Many of the computer store owners I have talked with were very enthusiastic about it, and it seemed to be one of the best selling systems on the market . . . possibly giving Radio Shack and Commodore a run for their money. The reader comments in the letters had all been very positive, so I was unprepared for the vicious attack in *Byte*.

Helmers, who, I understand, got the Apple free, may provide an object lesson for manufacturers who are feeling generous. He apparently could see no good in the contrivance. He didn't like

(continued on page 106)

EDITOR'S REMARKS

John Craig

Who Reads Kilobaud Magazine?

We not only have a reputation for being a magazine for "beginners" in this field—we flaunt it! I think we need to sit back and examine just who these "beginners" are, however. It's really very simple . . . we're all beginners to one degree or another. The person who just developed an interest in building or using a personal computer, and hasn't any background, is most definitely a *beginner*. (And speaking of that type of person: I recently heard of a company that didn't feel they should be advertising in *Kilobaud* because of this "beginners' magazine" image. What a hogwash attitude! Are they going to totally ignore that ever-increasing segment of the market?)

Those "total novice" individuals need to be examined much more closely because they're coming from several different directions and have different objectives in mind. *Kilobaud*, and every other magazine in the personal-computing field, is being bought primarily by computer *hobbyists*. Some of those other magazines purport to be aimed at the mass market . . . those millions of average middle-class Americans who will be buying home systems in the years to come.

The key phrase there is "will be buying." That market hasn't arrived yet, but it will—and, needless to say, we've all got our eye on it. But for right now (approaching the middle of 1978), *Kilobaud* is providing a lot of material for this mass market.

I've come to this conclusion as the result of recently teaching a couple of one-day courses on personal computing for the University of California. At the beginning of both courses, I opened with the comment that even though I was the editor of a computer-hobbyist magazine, I had no intention of directing myself to computer hobbyists. Those in attendance included newcomers interested in home computers, students, professional people (some in data pro-

cessing) and small businessmen. I was rather amazed at the number of times I made reference to articles in *Kilobaud* that would be of interest to those people.

These two groups were made up of end users, or the mass market, we've been talking about. If you stop and think about some of the practical applications programs we've run, hardware and software reviews, and small-business software, I think you'll see what I mean.

Many see this new mass market as being made up of people who simply want to take their new computer system home, plug it in, load a cassette program and run! I agree with that concept . . . to a point. That point is where these people begin to tire of all the "canned" programs they can buy . . . and get the itch to generate some of their own. (That's not hard to imagine because many of the younger generation will be programming the home computer to solve homework problems, and thereby exposing mom and dad to programming.) There will be another segment of these end users (most likely those with an electronics background) who will start tinkering with the system by adding new peripherals, modifications and capabilities.

Aha! You know what we're going to have then? More computer *hobbyists*! I wonder what magazine they'll be buying when they go down to their local computer stores?

Now . . . what about some of the other "beginners" reading *Kilobaud*? I hope computer stores, and readers, are directing small businessmen (under 5' 5") shopping for a system toward *Kilobaud*. We're doing our best to provide material to help them in selecting a system . . . with articles written with them in mind.

Now we get to the best part: all those professional computer engineers and programmers out there who read *Kilobaud*. You know, there really aren't that many people out there who are *experts* in every single area of this field. To put it quite simply, there are a lot of software types who are interested in expanding their

knowledge in the hardware area . . . and probably even more engineers interested in picking up on programming techniques. Those people are, of course, interested in reading *Kilobaud* for the same reason as anyone else: articles of general interest, objective hardware and software reviews, and *the ads*.

A good friend of mine recently pointed out something about *Byte* and *Kilobaud* that gave me some food for thought. He held up a copy of one of the two magazines and said, "This magazine is almost exclusively filled with esoteric, high-level articles and very little in the way of light reading material."

Picking up the other one, he said, "Then we have this one, which is filled each month with *mostly* light reading, short articles . . . and very little that you can really sink your teeth into. Two magazines: one which is too technical in content, and the other too light." He suggested that since *Kilobaud*, rather than *Byte*, could more likely balance things out, I should consider including at least one or two "heavy" articles in each month's issue. I'm inclined to agree with him . . . what about you? (Heck, this business of putting together a magazine is a snap! All you have to do is provide material that will satisfy tens of thousands of readers . . . all with varying interests!)

The Southern California Swap Meet

Got anything scheduled for July 1st? If so, get busy and cancel it . . . and don't plan to go out of town for the July 4th weekend . . . that is, if you live in Santa Barbara CA. If you don't . . . then, by all means, plan to drive there for the Southern California Swap Meet on July 1st. People will be coming from as far east as Phoenix . . . as far north as San Francisco . . . and as far south as San Diego . . . so there's no reason for *you* not to come!

Next month I'll include a map showing how to get to it . . . and a photo of the beautiful building the event will be held in. And, that's what it's going to be—an event: computer hobbyists, hams and electronics experimenters all getting together for a good time; and, without a doubt, that is the most important part.

Admission will be free . . . for buyers. Sellers can drop me a line

(continued on page 110)

AROUND THE INDUSTRY

John Craig

The following is from an official bulletin issued by the Santa Maria CA Police Department.

The DataSync Corp. was started in early 1977 by Colonel David Winthrop and advertised extensively in the national computer magazines. In late June 1977, Santa Maria CA Police detectives learned that Colonel Winthrop had used other names and had obtained driver's licenses under at least three names. Police learned that the Colonel had defrauded a Santa Maria man of

pretense thefts amounting to a quarter of a million dollars in five different states within the past four years, other local, state and federal agencies declined to prosecute him.

On February 26, 1978, Hunt, who had been serving his term at Chino State Prison, escaped from a minimum security facility.

Hunt is currently being sought by California authorities. Hunt is a white male, 6' 3", 220 pounds, with reddish-brown hair, and hazel eyes. He has worked as a TV repairman and has run busi-

The many faces of Norman Henry Hunt, Jr. (AKA Colonel David Winthrop).

\$10,000 under the pretense of designing a computer board for him, and detectives obtained an arrest warrant for Winthrop along with search warrants for his home and his business. Winthrop was arrested at his business and was held under \$100,000 bail.

A check of Winthrop's fingerprints revealed that his true name was Norman Henry Hunt, Jr., and that he had been a parole violator in California since 1965. Hunt was charged with three counts of false-pretense theft as felonies, and he entered a guilty plea to the charges. Hunt was sentenced to two years, eight months in prison on the Santa Maria charges. Although the investigation revealed that Hunt had been involved in fraud and false-

nesses marketing CB radios, computer products and jacks for trailers.

His method of operation has been to move to a town under a new identity, rent a house with option to buy and to make contacts in his field of endeavor (recently, computer hobbyists). Hunt will generally begin his operation by soliciting backing for product design from private parties. Often he will sell his qualifications so well that it is the victim's idea to ask Hunt to design a product for him.

Hunt may then start a business and solicit partners. He will rent a building, hire employees, begin a credit line with suppliers. After enough equipment has been received from suppliers on credit to

look impressive, he will apply for a bank loan to start production. He will usually go to a local bank rather than a large bank chain. If the loan is received, Hunt empties the business of its equipment and leaves the area, leaving the creditors and the bank high and dry.

Hunt also orders equipment from dealers and pays by check. He then stops payment on the checks. When contacted by a dealer about why he stopped payment, he may say that the product was defective and is being returned, and request that another unit be shipped.

When Hunt was arrested in Santa Maria, he had a loaded shotgun in his closet at home, and he may be considered dangerous.

If anyone has information that may relate to this suspect, please contact Detective Ernest L. Kapphahn, Santa Maria Police Department, (805) 922-7811, or Investigator Zeke Hernandez, Chino State Prison, (714) 597-1821.

SS-50 Bus Manufacturers Meet

All manufacturers of SS-50 bus compatible hardware met at the second Computer Faire in San Jose to discuss possible new bus signal assignments. Represented at the meeting were Southwest Technical Products Corp., Midwest Scientific Instruments, Smoke Signal Broadcasting, Gimix and The Micro Works.

It was agreed the uniformity of use was essential to protect current and future users of the bus from the incompatibility and general chaos now being faced by S-100 bus users and manufacturers. It was agreed by everyone present that any revised, or additional bus line assignments would be cleared with all concerned

before being designed into equipment. A suggestion to change the present "Phase 1" line to "Slow Memory" was made by Mr. Childress of Midwest Scientific Instruments. Several others present agreed that this was a reasonable change, since "Phase 1" was a redundant signal that could be obtained by inverting "Phase 2," which is also present on the bus. If no objections are found, this change will be considered for action by all manufacturers of the SS-50 bus to make the change official.

A discussion of possible additions, or changes, to the bus system for MC-6809 processors brought up the subject of monitor and software compatibility in these machines. It was agreed that Mr. Dave Shirk of Technical Systems Consultants, Inc., would be asked to recommend jump table addresses that would be used by all SS-50 manufacturers in these systems. This would insure that all users of this advanced processor on the SS-50 bus would be able to interchange hardware and software easily between monitors written by different sources.

Mr. Robert Lentz, president of The Micro Works, reported that he had conducted some experiments with high speed processors and that he had found no problems with crosstalk, or any need for terminations, etc., at speeds up to 3.0 MHz with a standard SS-50 bus.

The next meeting of the SS-50 Manufacturers Association will be held at Personal Computing 78 in Philadelphia. All manufacturers of SS-50 bus compatible products are invited. All users of the bus are also invited to participate in the meeting and to send any suggestions they may have to any of the above manufacturers for consideration at this meeting.

Intertec's
SuperDEC

"pull out the guts & screw in the brains"

While we'll admit the difference in appearance between the DECwriter II and our new SuperDEC is difficult at best to see, the difference in performance is astounding! The SuperDEC is our new Throughput Optimizer designed to be easily installed in your existing DECwriter II teleprinter. Not only can our SuperDEC Optimizer increase the print speed of your DECwriter II by as much as six times its original speed, it also gives you the features offered only by our famous SuperTerm teleprinter. Features you couldn't get on your DECwriter until now.

You've undoubtedly already heard of our SuperTerm. It's the 1200 baud teleprinter that has been replacing DECwriters by the thousands. And while you may have purchased your DECwriter prior to the introduction of our state-of-the-art SuperTerm, you can now have all of the SuperTerm's incredible features without having to throw out your DECwriter.

With the SuperDEC Optimizer installed, you will have such nifty features as bidirectional printing, manual and automatic top of form, full horizontal and vertical tabs (addressable and absolute), adjustable right and left margins, an RS-232C interface, a double wide character set and up to 32 user programmable characters. You can also add an APL character set, selective addressing and an answer back feature at nominal cost.

The SuperDEC Optimizer is designed to replace the digital electronics in your existing DECwriter II. In less than five minutes, your DECwriter can be transformed into a SuperDEC. The SuperDEC Optimizer is completely "plug-compatible" with the cables in your DECwriter. The only installation tool required is one that we give you—a screwdriver. Just pull out the guts and screw in the brains. No special technical skills are required. And if you get bored watching your DECwriter print faster than you can read, the old digital electronics may be reinstalled in a matter of minutes. It's really just that simple.

Every SuperDEC Throughput Optimizer carries a full one year warranty on all parts and workmanship. But our commitment to excellence in service goes beyond the warranty. Intertec can also offer on-site service contracts for all of your upgraded SuperDEC equipment.

So, when you're ready to "pull out the guts and screw in the brains", contact us at one of the numbers below and we'll give you the name of your local SuperDEC dealer. He'll show you what a difference \$395 can make.

\$395.00
and
your old DECwriter

Computer Portraits from Micro Works!

Computer portraits have fascinated me for several years, but not for the reason you might think. The electronics, the software and the hardware of the system aren't much of a mystery, or a fascination. No, I've always been amazed at the tremendous cost of such systems and knew it was just a matter of time before some enterprising micro enthusiasts came along and developed one we could all buy. Well, it's happened. Let me tell you about it. . . .

In last month's editorial I gave you an introduction to what the folks at The Micro Works are up to. They've been building S-50 6800 boards for some time now (they have an EPROM Programmer, PROM board, Universal I/O board and extender boards), but their latest is really something!

They have developed a digital video system, called the Digisec-

tor^R, which interfaces an inexpensive TV camera with a Southwest Technical Products 6800 system. The TV image is converted, by the Digisector board, into

a high-resolution digitized picture . . . and stored into the computer's main memory. So far, so good . . . and, up to now things have been *quite* inexpensive: the cost of an SWTP 6800 system, a \$200 to \$300 television camera, a video monitor for \$150, \$170 for the Digisector board and a terminal for the computer. Not too bad, right? Now we're going to have to spend a few bucks for a good high-quality printer . . . and the Micro Workers feel the Malibu 160 is the best for the job . . . and from what I've seen, I'll have to agree (catch the review on that printer in this month's *Kilobaud*).

Now, let's do a recap of the hardware, while referring to Photo 1. Going clockwise, starting on the left-hand side of the table, we have the TV camera sitting on top of the terminal (incidentally, you're going to need

some floodlights aimed at the subject), then we have a monitor for the video, the SWTP system with the Digisector sitting on an extender board (the right one), minimum of 18K of main memory and last, but not least, the Malibu printer. Add it up . . . it's a heck of a lot less than anything you've seen before! (The cost of the Digisector board includes the computer portrait software.)

Photos 2 through 6 will introduce you to the sharp team at Micro Works who put it all together . . . and Fig. 1 speaks for itself; The Micro Works/Malibu combination is a real winner! (By the way, they have an 8080/S-100 version of the board in the works, which will sell for about the same price.)

Micro Works, PO Box 1110, Del Mar CA 92014. Ph: (714) 756-2687.

Photo 6. Bob McMann, tech writer and senior technician.

BOOKS BOOKS BOOKS

8080A/8085 Assembly Language Programming Lance A. Leventhal

Adam Osborne & Associates, Inc.
PO Box 2036, Berkeley CA 94702
\$7.50, 400 Pages

Assuming that there are other computer hobbyists who enjoy assembly-language programming as much as I do, I would like to pass on my thoughts about *8080A/8085 Assembly Language Programming* by Lance A. Leventhal.

I use assembly language in situations where BASIC won't do the job, such as graphics, input-output, or where BASIC programs won't fit due to memory size limitations. In addition to the usual I/O operations (keyboard, printer and video), I turn various external devices on and off under computer control. This requires being able to manipulate CPU registers, addresses and data lines; it takes assembly-language programming to do this.

I have written many programs, but after skim-reading this book I realized that I have missed the significance of, or misused, many 8080 instructions. A second, more thorough, study confirmed this and contributed greatly to my assembly-language programming ability.

Table 1 is an outline of the contents of Leventhal's book. Just about every possible question that you could come up with is answered in one or more of these chapters. Chapters 1 and 2 serve as the appetizer—a comprehensive discussion of assembly-language programming and assemblers.

Chapter 3 does more than just list the instructions with a brief description; a half page or more is devoted to each instruction and explicit examples promote better understanding. Nowhere else have I seen the 8080 instruction set explained with such detail and clarity.

Chapters 4 to 12 are the main course; they take you from the simple program through every

conceivable CPU operation. I found the code-conversion and I/O information especially interesting since my current project is to interface an EBCD Selectric Data Terminal to my SOL.

There is hardly a page in this book that does not contain at least one example program with source and object coding plus flowchart. These examples are really subroutines that you can use in countless programming situations.

A partial list of these subroutines might include: checksums, finding a given ASCII character, changing the parity of a string of characters, ASCII-to-decimal conversion, addition, subtraction, multiplication, division, sorting, indexing a table, code conversion and so much more. In fact, the emphasis in chapters 5 to 12 is on subroutines that can be combined to form more complex programs.

Chapters 13 to 16 tie together everything you have learned. This is the dessert course. My assembly-language programming technique always started with coding after some sketchy mental problem definition. Dr. Leventhal has convinced me that this is wrong. Problem definition and program design should come first, followed by coding, debugging, testing, documentation, maintenance and redesign.

1. Introduction to assembly-language programming
2. Assemblers
3. 8080/8085 instruction sets
4. Simple programs
5. Simple program loops
6. Character-coded data
7. Code conversion
8. Arithmetic problems
9. Tables and lists
10. Subroutines
11. Input-output
12. Interrupts
13. Problem definition and program design
14. Debugging and testing
15. Documentation and redesign
16. Sample projects

Table 1.

8080A/8085 Assembly Language Programming has many more points to make . . . too many to cover here. This is not a one-evening book. If you have an 8080 or 8085 (improved 8080) CPU or have access to one, the ideal learning situation is to try the examples as you go along. Each chapter has, in addition, a series of problems for which clues, but no coded solutions, are supplied. These give you a chance to try your hand at assembly-language programming.

Particularly interesting is the discussion on various programming methods: flowcharting, modular, structured and top down. Although no one method is touted as being *the best*, each is explained, and advantages and disadvantages presented. Clearly, the author leans toward structured programming.

Major statements are printed in boldface type, and explanations to these statements are printed in a lighter type. The tendency is to read only the boldface sentences until you come to one that you don't understand, at which time you read the lightface type for clarification. Out of habit, I found myself reading it all.

This is definitely a software-oriented text, but an amazing amount of hardware information is given in the I/O and interrupt chapters—probably enough to implement any of the designs discussed.

So far, I have covered all the book's good points but none of its bad ones. That is probably because I couldn't find anything to criticize. My only negative reaction has to do with *8080A/8085 Assembly Language Programming* having been advertised as available in October 1977, which is when I ordered and paid for it; it was actually not printed until late January 1978, which is when I received it.

In my opinion, *8080A/8085 Assembly Language Programming* is a worthwhile text; and I'm hoping for a Z-80 version soon. If my technical library had to be reduced in size for some reason, this is certainly one book I would keep on the shelf!

Tombstone AZ

Simplified BASIC Programming
Gerald and Joan Silver
McGraw-Hill, New York
1974, \$12.85

Simplified BASIC Programming is an excellent text for those

of you who have absolutely no experience in computer programming and occasionally need to look up the definition or application of an instruction. *Simplified BASIC Programming* is an excellent reference manual.

The first section of the book is devoted to an in-depth explanation of the operation of a time-sharing system. For those of you who have access to a time-sharing system, this section is invaluable. For the microcomputer owner, this section may be skipped as your system probably operates in a substantially different manner.

The second section describes, in easy-to-understand language, how most of the instructions are used. I say *most* because in 1974 BASIC was not as sophisticated as it is today. Examples of the use of each instruction or combinations of instructions are clearly stated. At the end of each chapter, a review and a quiz are provided.

The last section of the book contains example programs with complete documentation and a description of the way the problem was solved.

This book is a good reference for those of us who can't seem to remember whether a comma or a semicolon is necessary to print closely spaced output, or any other syntax problem that may drive you to the brink of insanity.

Although *Simplified BASIC Programming* is available through any bookstore, you may find a used copy for sale at substantial savings at your friendly, neighborhood college bookstore. And if you are really watching your budget, you may find *Simplified BASIC Programming*, along with other informative reading on BASIC, at your local library.

Jim Cambron

The 8080A Bugbook
Rony, Larsen, Titus
Howard W. Sams & Co., Inc.
Indianapolis IN
\$9.95, paperback

One book out of a hundred makes you wish you had seen that one before slogging through the other ninety-nine. This is such a book. It should be subtitled "All You Wanted To Know about the 8080 and Its Support Chips, but Didn't Know Where To Look."

In the Bugbook tradition, the 8080A neatly balances theory and practical example. It comprises eight chapters with titles such as,

"What is a Microcomputer?" and "An Introduction to Microcomputer Programming." They are all informative and readable.

Unfortunately, there are some errors (no doubt accidental, but possibly confusing to the reader). Occasionally, the authors give a detailed explanation that ends just when you expect some vital truth to be revealed; but these rare omissions serve mainly to demonstrate the thoroughness of the rest of the book.

Each chapter begins with an outline and ends with a summary and some searching questions. In light of its format, it could well be used as a textbook. Let's take chapter 4 to consider the book's style.

Title: Generating an output pulse.
Outline: Objectives, definitions, 8080 I/O instructions, device select, pulse decoding, sample microcomputer program, device select pulses as control pulses, example, test, and "What have you accomplished in this chapter?"

Introduction: "In this chapter you will learn how to generate device select pulses . . ."

At the end of the chapter the reader is asked to "draw a schematic diagram for a circuit that can generate up to 256 different device-select pulses."

And if you read the chapter you should be able to do the above, and a great deal more.

In following chapters the authors explain the use of these and other signals for the control of outside devices via timing loops and other programming sequences. Throughout, however, they stress keeping the hardware simple and exercising control by software.

I appreciated most of the simplified, no-mystique approach to several things that had long bothered me—among these were flag testing, the use of status words, and the inside working of the many conditional branch instructions. The entire instruction set is covered in greater detail than I had previously encountered. It is methodically considered by function—by grouping the related logical operations, for example—and whole pages are devoted to illustrating certain instructions that might be considered tricky or difficult.

The use of octal may disappoint some readers. The explanation is that the 8080 instruction set was designed this way. Logical operations all begin with 2 in octal, and MOV instructions with 1. The accumulator is 7 and the memory 6. Thus, MOV A,M and

MOV M,A are 176 and 167, respectively, much easier to remember than two dissimilar hex codes.

The book's overall theme is that the microprocessor is a useful tool. No mention is made of high-level languages, games or heavy number crunching; the interfacing is to practical devices and the programs are in simple machine language, all designed to "do something." And although the special 8080 support chips are all covered in some detail, TTL alternatives are explained where they can be applied.

It is difficult to classify this as either a hardware or a machine-language software book, since it is really both. If the reader could previously build a kit or follow a program, he should, after digesting this volume, be able to design much of his own hardware and write programs to interface with other devices. That's a lot to learn for only ten bucks.

Ernie Brooner
Lakeside MT

The Home Computer Revolution
Theodor H. Nelson
The Distributors,
702 So. Michigan South Bend
IN 46618, \$2

Most computer hobbyists, or those about to get into computing, will find this book easy to read, as well as entertaining. It is neither a technical book, nor a dry history book. The author has combined semitechnical material, computer-historical anecdotes and his forecast of the role of the computer in the future.

Reading this book, I found that my level of interest wavered between near boredom to moderate interest. However, because of the nature of the material, another reader might find different peaks and dips of interest.

For instance, as an advocate of the Altair bus, I reacted favorably to the author's repeated support of this configuration. A reader using the Digital Group bus, for example, might be disinterested in the Altair bus coverage.

At the other end of my interest spectrum, I found the frequent attacks on IBM to be objectionable. I have no particular like or dislike for IBM, but I certainly found the repeated negative attitude distracting.

It's a matter of psychology—if you like the Altair bus and have something against IBM, you'll enjoy the author's comments; on the other hand, if you don't like

the Altair bus structure and have a high regard for IBM, you won't enjoy reading this book.

A little more than half of *The Home Computer Revolution* is related to the author's predictions of the future home-computer world. Therefore, if you are going to read this book, do it now; very shortly, these precarious prognostications will either be history or wrong guesses. Some of the predictions concerning future home-computer input/output devices and techniques seem way out (but so was 1984 not very long ago).

On the positive side, I thought the historical notes on Mits, Cromemco and other companies were very interesting. Those readers new to home computing will find some seldom published background information.

There are brief hardware descriptions (Altair bus oriented), but with home computing moving so fast, a book would have to be published in loose-leaf style to keep up with the hardware changes. Only a monthly magazine, such as *Kilobaud*, can hope to keep you informed on the current hardware.

The program-languages descriptions are short, with most languages getting only one paragraph. The author suggests that a person learn programming with a BASIC interpreter, and this is probably what most home computerists are doing.

A serious oversight occurs on page 117. Add the following to the lists of available magazines on that page: *Kilobaud*, Peterborough NH 03458.

The Home Computer Revolution is light reading and generally entertaining; one of my next reading projects will be *Computer Lib* (\$7, same source), which is referred to often in this latest book by Theodor Nelson.

Gordon Flemming
Sylmar CA

Home Computers: 2nd Questions and Answers;
Vol. 1: Hardware (\$7.95)
Vol. 2: Software (\$6.95)
Rich Didday dilithium Press
Forest Grove OR 1977

These two books fill a definite need. Most people who get started in the home-computer field find themselves in one of three situations: They know quite a bit about software but nothing about hardware; they know quite a bit about hardware but nothing about software; they don't know

much about either one.

The idea behind these books is that you can buy Vol. 1 if you're in the first category, Vol. 2 if you're in the second category, or both if you're in the third category.

That's the idea behind the books, but how well do they pull it off? Pretty darn well, I'd say.

Together, the two books represent a heavily edited transcript of nine days of conversation between two people on the subject of home or hobby computing. One of the participants (called "A" because he provides the answers) has a strong background in computing in general (both hardware and software), and home computing in particular.

The other participant (called "Q") is an intelligent, interested newcomer to the field who has visited the computer stores, picked up some literature and bought a few magazines, but needs further help to figure out what it all means. He doesn't understand too much of what he's read, and wants to know, for example, what is really involved in putting a computer kit together.

Is he better off getting a fully assembled system? Why are there so many different microprocessor chips? What does all this RAM/ROM/PROM/EPROM stuff mean? What's involved in programming? Why are there so many different programming languages? What can you really do with a home computer?

1024 is 2¹⁰, which is the number of questions and answers in the two books—thus the title for the work. But it's more than just a bunch of disjointed questions thrown together. The books are well organized and proceed logically from one topic to the next, building up your knowledge and tying things together as you read.

Of course, neither book is going to enable you to become a professional programmer or hardware designer overnight, but they'll give you a better idea of what these people do, and introduce you to some of the basics as they relate to home computing.

Usually, when I read an introductory level book or article on computing, I find myself saying, "That's not a very good example," or "Boy, that's sure going to mislead somebody." These books are a rare exception. The questions and answers both have a nice balance of simplicity, accuracy, and (amazingly enough) realism, and actually convey the

NEW PRODUCTS

Plotters—Kit and Assembled

Sylvanhill Laboratory, Inc., has been sold to Pitsco, Inc., and offers plotter kits and plotters completely assembled. The kits require the purchaser to mount them on a drawing surface (console also available as a new product of Sylvanhill) and to do the interconnection between the control PC boards and his computer. Plotters require an 8 bit parallel I/O port and 5 and 24 V power sources. A basic 8080 software program is included in the owner's manual.

Sizes available are 11 x 17 (\$795 in kit form), 17 x 22 (\$950 in kit form) and 22 x 34 (\$1300 in kit form). Consoles priced separately.

Contact the new offices and manufacturing facilities of Sylvanhill Laboratory, Inc., PO Box 646, Pittsburg KS 66762.

202 Video Camera Kit

Solid State Sales 202 Video Camera Kit may be used for visible or infrared viewing for character recognition with computers with external circuits. It will operate in a vacuum, under water, at high altitude or in a magnetic environment because there is no high voltage or magnetic deflection. In addition, it may be used for IR surveillance with an IR light source, and is excellent for standard surveillance work because of its light weight (under 1 lb.) and small size.

Some advantages offered in this new kit from previous models are all clock voltages operating at

6 V requiring no adjustments, and a higher video output signal. The circuitry has been simplified for easier assembly, and a two-level TTL output is supplied for interfacing. In addition, a power board is supplied so only a 5 V, 1 Amp power source is needed, and, in the near future, Solid State Sales will supply a computer interface card.

This kit includes all semiconductors, boards, data sheets, diagrams, resistors, capacitors, and an 8 mm lens. Assembly has been simplified so that the only equipment needed is an oscilloscope, soldering iron and some wire. The complete kit sells for \$349 (\$75 to assemble and test).

Solid State Sales, PO Box 74K, Somerville MA 02143.

Serial Interface Module

The 9650 is an asynchronous serial interface module specifically designed for compatibility with the M6800 microprocessor bus. It is pin and outline compatible with the Motorola EXORciser and Micromodules and with the MEK6800D2 Evaluation Kit. It features full address decoding and fully buffered data, address and control lines. This module utilizes 8 MC6850 Asynchronous Communications Interface Adapters with full RS-232C signal conditioning. An on-board bit rate generator simultaneously provides 14 standard rates that can be individually strapped to each ACIA.

The 9650 occupies 16 consecutive memory addresses. The lowest 8 of these access the 8 con-

PerCom's LFD-400 system.

trol/status registers and the next 8 access the transmit/receive data registers. This map arrangement allows optimum use of indexed addressing in I/O systems and permits the use of a very tight interrupt polling loop.

The standard configuration of the 9650 is fully populated to 8 channels. Prices range from \$395 in single quantities to \$237 at 100. A partially populated 4-channel version is also available at lower prices.

The 9650 is one of a family of M6800 support modules. All cards of the family are 6.05 inches by 9.75 inches and utilize a 43-pin dual readout edge connector with 0.15625 inch pin spacing.

Creative Micro Systems, 6773 Westminster Avenue, Westminster CA 92683.

Disk Storage System for the SS-50 Bus

PerCom Data Co.'s LFD-400, a minifloppy[®] disk memory system for the SS-50 bus, includes a controller PC board, PROMware disk operating system, disk drive and drive power supply, interconnecting cable, two minidiskettes, an operator's manual and a compact enclosure to house

the drive and drive power supply. System components may be individually purchased, and 2- and 3-drive systems are also available.

The controller board, which is installed in an SS-50 bus slot of the host computer, includes special low-voltage-drop regulators, a proprietary "bit shifting" compensation circuit, an inactivity time-out circuit to increase drive motor life, and provision for 3K bytes of PROM. The LFD-400 PROMware DOS, miniDOS, allows SS-50 bus owners to use their existing software with simple patches. This was a priority consideration in the development of miniDOS.

The LFD-400 uses the Shugart SA-400 drive. Disk speed is 300 rpm, which gives a data-transfer rate of 125 kilobits per second. The read/write head is stepped from track to track at 40 ms per step. The SA-400 drive system features a positive media interlock, which prevents door closure on a misaligned disk, and write protection circuitry. The LFD-400 storage media is a 10-sector hard-sectored minidiskette, which accommodates 89.6K bytes of data on 35 tracks. The recording technique is Bi-Phase-M (also known as "double frequency").

PerCom Data Company, Inc., 318 Barnes, Garland TX 75042.

CT Terminals

COMPUTER TEXTile announces its line of high-quality hard-copy hardware. CT sells reconditioned QUME and Diablo daisy wheel printing terminals, which feature 30-cps printers, 96-character keyboards with 10-key numeric pad, ASCII coded, RS-232 interface.

Also included are 256-charac-

Some of Sylvanhill's wares.

The CMS 9650.

The Innotronics Series 400 floppy disk drive.

ter buffer, user's and service manual, with full graphics capability packaged in a cabinet with black-and-chrome-wheeled pedestal. Options include 45-cps and 55-cps mechanisms for some QUMEs, other encodings, pin-feed platen, tractor forms feeder and service contracts.

Each terminal comes with a limited 30-day warranty. Quantities are limited. Prices from under \$2000. Also available are reconditioned ADM-1s, modems and paper tape punch/readers.

COMPUTER TEXTile, 10960 Wilshire Blvd., Suite 1504, Los Angeles CA 90024.

Innotronics Floppy Disk Drives

The new Series 400 diskette drive, offering an array of new features that were previously unavailable in the market, has recently been introduced by Innotronics. Unique new features include automatic head-unload and stepper motor time-outs, bidirectional write-protect, radial stepping ability for truly overlapping seeks, host power-failure detector and six different LED activity indicator electronics.

Both the Model 410 (soft-sectored, IBM-compatible) and the Model 420 (hard-sectored) provide single- and double-density recording capability. In addition, a proprietary data separator design, coupled with a digital noise filter and a unique way of handling recorded signals, results in 35 percent greater data integrity margins.

The Series 400 also incorporates the field-tested Innovex mechanical design, which includes filtered air operating environment, single-side accessibil-

ity for maintenance, mechanical door interlock with a manual override button, targeted media loading, and a patented "wear-free" diskette hub rated for over 100,000 insertions. Prices for the Innovex Series 400 range from \$575 in single quantities to \$435 each for orders of 100.

Innotronics Corporation, Brooks Rd., Lincoln MA 01773.

Printer Interface for Apple II

Microproducts has announced a printer interface for the Apple II computer which is compatible with the Southwest Technical Products PR-40 Printer. It will be marketed as a preassembled PC board that plugs directly into the Apple II computer, an interconnecting cable and a cassette containing the operating software.

The printer prints one line at a time when the return key is struck. The printer subroutine can also be called in BASIC to print the entire contents of the video screen. While in the BASIC mode, using the list subroutine, the printer will continually record the program, while the video screen scrolls up one line at a

CSD's Microdesk.

time. The complete plug-in interface with software sells for \$49.95.

Microproducts, Dept. K, 1024 17th Street, Hermosa Beach CA 90265.

Microcomputer Storage System

The Computer Systems Design Microdesk is a new addition to *Kilobaud's* microcomputer lab. (We ran a release on the Microdesk in November 1977; now we've had a chance to utilize it.) The desk's ease of assembly makes for a quick and useful addition to any room, with one adjustable shelf that you can arrange to your specific needs. Because of its air-vented design, the upper shelf is an excellent location for your unit. You can keep the unit close at hand without its being in the way. There's plenty of room for your terminal, and a sliding keyboard shelf can put the keyboard within comfortable reach—or out of the way when you're not using it.

The lower shelf fully handles the task of holding all the manuals that accompany a small microcomputer lab. The Micro-

Wintek's analog interface module.

desk is sturdily designed to last a long time under normal conditions.

Computer Systems Design, 1611 E. Central, Wichita KS 67214.

Microprocessor Analog Interface Module

The Wince Analog Interface Module makes it easy for laboratory and control engineers to interface thermocouples and other transducers to a microprocessor. It makes it equally easy to interface the microprocessor to motors, servos, etc. Options include a 16 channel multiplexer, an 8, 10, or 12 bit analog-to-digital converter, and one or two 8 bit digital-to-analog converters. The base price is \$99. Other Wince Modules include the Control, RAM, ROM, EROM Programmer, CMOS RAM/Battery, Driver/Sensor, Console I/O, Cassette Interface.

Wintek Corp., 902 N. 9th St. Lafayette IN 47904.

The Stringy Floppy

The Exatron Stringy Floppy™ is a subsystem consisting of a con-

Microproducts interface with Apple and PR-40.

Exatron's Stringy Floppy.

Central Data 2650 Computer System.

Northwest's 85/P.

control board connecting to the S-100 bus, a small drive module outside the computer mainframe and the connecting cable.

The individual continuous-loop tape wafer, less than a fourth the bulk of the standard audio cassette and holding up to 40K bytes, is inserted in the slot in the front of the drive module, and will save or load 4K bytes in about 5 seconds. All operations are software controlled; the utility programs are contained in an EPROM on the control board. The subsystem is delivered ready to operate, and is backed by a one-year full warranty and a 30-day money-back guarantee.

Exatron Corp., 1030 East Duane, Suite 1, Sunnyvale CA 94086.

The Electric Pencil II

Michael Shraye Software, 3901 Los Feliz Blvd., Los Angeles CA 90027, announces the Electric Pencil II. Some of the new features include: CP/M compatibility, simple file management, dynamic print formatting, multi-column printing, cassette backup capability, centering, underlining and boldface.

The Electric Pencil II is now available on CP/M—standard printer versions \$225; Diablo printer versions \$275. System hardware must include: 8080 or Z-80 based microcomputer, printer, video display, CP/M supported disk system, or North Star minifloppy disk, or cassette interface (Tarbell or SOL).

The Electric Pencil I is still available for non-CP/M users. Contact Michael Shraye for more information.

Central Data Boards

Central Data, PO Box 2484,

Sta. A, Champaign IL 61820, offers a 16K RAM board specially designed for use in S-100 computers. The dynamic memory board uses a reliable refresh method that inserts cycles between the computer's normal access cycles. The 16K RAM board uses less than one-half the power of a comparable static RAM board.

CD's board comes completely assembled, tested and burned in—just plug it in and start using. Each board also comes with a full one-year warranty. Price is \$289. There is capacity on the board for up to 32K RAM (\$475), or add 16K for \$200.

S-100 extender board, assembled and tested, is \$110. The 2650 Computer System board retails for \$275. System board features include: 80 x 16 line display, 2650 microprocessor, 300 baud cassette interface, supervisor program, two parallel ports, one input and one output, and 2048 bytes of read-write memory.

Naked Terminal Cuts Dumb Terminal Costs 1/3

Dynabyte, Inc., lowers the cost of a dumb terminal with its Naked Terminal, an S-100 module that functions with a key-

board and video monitor.

The Naked Terminal, priced at \$395, displays 80 characters by 24 lines, using both uppercase and lowercase characters in a 5 x 7 font. Half duplex, full duplex and a block mode that allows editing before transmission are features of the Naked Terminal. Editing is aided by an addressable cursor.

Switch-selectable features include black-on-white or white-on-black, blinking or nonblinking — cursor, and variable baud rates.

No software is required. The Naked Terminal can be configured by DIP switch to drop into an existing system, replacing the serial I/O card and stand-alone terminal without making any changes to software.

The Naked Terminal is a complete dumb terminal on an S-100 board. It contains a microprocessor with its own memory, its own software drivers and its own internal bus. It won't take up any of the 64K memory address space of the S-100 bus.

Like all Dynabyte products, the Naked Terminal is completely assembled, socketed, tested and burned in. Dynabyte's guarantee is for a full year—the longest in the industry.

Dynabyte, Inc., 4020 Fabian, Palo Alto CA 94303.

Dynabyte's Naked Terminal.

The EXP650.

8085 + PASCAL = 85/P

The new 85/P, programmer's workbench from Northwest Microcomputer Systems, Inc., combines the throughput of the 3 MHz Intel 8085 and the power of PASCAL.

The standard system features: (1) 8085 CPU with 54K bytes of static user RAM; (2) one megabyte of storage in two double-density Shugart floppy-disk drives; (3) 24 x 80 high-resolution display with 103 station Hall effect keyboard; (4) two serial ports for printer and second terminal or modem; (5) a choice of attractive solid oak or walnut cabinets that enhance any home or office.

The 85/P gains its efficiency in program preparation and code execution from the increasingly popular PASCAL language. The 85/P provides the full PASCAL environment including a 700 lpm compiler/interpreter, random and sequential files, a screen-oriented editor, interactive, source-linked debugger, plus full documentation and a 90-day warranty.

The complete system costs \$7495. Delivery is quoted at 30 to 60 days, with Northwest Microcomputer Systems paying for delivery on any order shipped later than 60 days. A variety of options is available.

Northwest Microcomputer Systems, Inc., 121 E 11th, Eugene OR 97401.

"Byte-Size Breadboards" from CSC

The age of LSI has put a lot of power in Lilliput for users of Continental Specialties Corporation Experimentor Socket solderless breadboards. This seems especially true for the palm-size EXP350 and EXP650. Each is just 3.6 inches long. The EXP350 offers .3 inch center spacing to

accept standard DIP packages; the EXP650 offers the wide .6 inch spacing appropriate to wide LSI DIPs. Their small size offers the perfect opportunity for byte-size modularity. This can happen in several ways.

A complex LSI function IC like a UART, for example, can be accommodated, along with pertinent support discretes and connecting cables as a module on a CSC EXP650. An LSI function can be synthesized with less complex circuitry. A counter, decoder and display, for example, can be combined on a single EXP350 and treated as a unit—as can a data converter, an interface circuit or any of a number of functional modules.

CSC's EXP350 is priced at \$5.50 (unit), the EXP650 at \$6.25.

Continental Specialties Corporation, 70 Fulton Terrace, New Haven CT 06509.

REX Computing System

RCC introduces REX—the total microcomputer system, fully assembled, complete with a Z-80 CPU, 24K of RAM, video output, system keyboard, a microfloppy disk drive featuring double-sided recording, cabinet and power supply.

The REX system includes an S-100 motherboard containing the CPU, video display interface, bootstrap and Monitor PROM, and powerfail and vectored interrupt circuitry. The system comes complete with a modern walnut-sided cabinet and a 15 Amp power supply, and includes space for a second microfloppy drive plus five slots for S-100 bus options.

A complete line of low-cost software options is available. These include ANSI FORTRAN IV with subroutine library and 8080 and Z-80 extensions, including advanced math and string-handling functions; floppy-disk operating system; file manage-

GRI Model 756 keyboard.

ment system; text editor; and linking loader.

RCC offers a wide range of options for the REX system, including b & w or color video monitors, rf modulator generator, expansion microfloppy drives, RAM memory to 64K on the motherboard (no bus slots needed), a 120 cps 80/96 column printer programmable serial communications channel, and a data communications modem. The REX system lists for \$2495, assembled and tested only.

Realistic Controls Corp., 404 W. 35th Street, Davenport IA 52806.

New Model 756 Full ASCII Keyboard

The Model 756 keyboard from George Risk Industries provides encoding for all 128 ASCII characters and control functions, imposing no limitations on software design or hardware capability. Utilizing reliable IBM series keyswitches and low-power MOS encoder circuitry, Model 756 is designed to bridge the gap between basic keyboards and expensive custom OEM models. Assembly and mounting are simplified through OEM industrial grade components and a rugged MIL-grade printed-circuit board. The durable circuitry is complemented by custom molded keytops and a line of heavy-gauge steel enclosures for desktop use.

The 756's complete line of ac-

cessories includes a numeric pad, custom cables and connectors. The versatile interface allows user selection of parity, positive or negative logic data and strobe outputs, alpha lock operation and both dc level and pulse strobe signals. A latching shift lock key is included, and all outputs are TTL-DTL-MOS compatible. Kit is \$64.95; assembled and tested model, \$75.95. A matching enclosure, Model 702, is \$29.95.

George Risk Industries, Inc., GRI Plaza, Kimball NE 69145.

Computer-related Cases

The Buckeye Stamping Company, 555 Marion Rd., Columbus OH 43207, now offers instrument cases with keyboard holders and CRT canopies. These computer-related additions, fabricated of durable, extruded aluminum, are offered in standard 17 inch widths. The new cases are now offered with blue or black vinyl tops with matching feature stripes, or with teakwood vinyl as an option.

The new Buckeye computer-related cases sell in small quantities in a price range of \$110 or \$215, complete.

Power Supply for KIM

K L Power Supplies, PO Box 86, Montgomeryville PA 18936, announces the model 512 power

K L Model 512 Power Supply.

Bottom oscilloscope signals show noise reduction made possible by the Glitch Grabber.

supply for MOS Technology KIM users, and for others needing a 5 volt and 12 volt regulated supply. The model 512 comes completely assembled and includes a total 4.3 Amp capacity and additional 8K memory.

The K L power supply features +5 volts regulated with 1.4 Amp maximum, +12 volts regulated with 1.0 Amp maximum, +8 volts unregulated with 4.5 Amp maximum, and +16 volts unregulated with 1.0 Amp maximum. It has regulated outputs with current limit and thermal overload protection, fuse-protected primary, ac line cord, and connector cable.

The unit is enclosed in a Bakelite case with aluminum bottom plate and rubber feet. It is 6.8 x 5.6 x 3 inches and weighs 3.5 lbs. Price is \$37.

New "Glitch Grabber" from Extensys

A board interconnection device from Extensys Corp. significantly reduces noise, glitches and jitter on the S-100 microcomputer bus and carries a suggested retail price of \$79.50 in single quantities (large-volume discounts available). Called the "Glitch Grabber," the printed circuit edge-connective device maintains clean signals on the notoriously noisy S-100 bus, safeguarding the low tolerance volt-

LETTERS

PC Board-makers, Take Note!

Your otherwise fine article on making printed circuit boards (*Kilobaud*, April 1978) fails to give instructions and precautions for handling the chemical used to develop the photoresist-coated boards. The resist developer recommended is of completely different nature than the chemicals normally encountered by the home photography enthusiast.

I'm sure that your readers are aware that the resist developer is flammable and will take precautions to exclude potential ignition sources. They may not be aware that methylene chloride is the active ingredient in paint remover. As such it will rapidly ruin any painted or varnished surface with which it makes contact. A more serious consequence of splashes is that the developer is a serious skin and eye irritant.

Methylene chloride is an extremely volatile liquid. This means that a room containing an open tray of the developer solution would rapidly have its air contaminated with substantial amounts of the vapor. In a small bathroom with the windows and doors closed to make a temporary darkroom, the vapor concentration could far exceed the recommended peak exposure level. The present federal peak limit is 2000 ppm, but the National Institute for Occupational Safety and Health has recommended that it be substantially reduced.

Methylene chloride, which enters the body by inhalation, is rapidly metabolized. One of its breakdown products is carbon monoxide. This reacts with the hemoglobin in blood and reduces its oxygen carrying capacity. The heart and circulatory system must then work extra hard to pump blood faster in an attempt to make up for the decreased oxygen supply. Methylene chloride also affects the central nervous system as an anesthetic.

I recommend that anyone using a developer containing methylene chloride follow the general recommendations for paint removers in *Consumer Reports* (August 1976, page 434):

● "If at all possible, work out-

doors. And try to stay upwind . . . If you must work indoors, make sure there's plenty of ventilation—not just from an open window or two, but from a strong window exhaust fan.

● "Wear neoprene rubber gloves and goggles. If you splash yourself, wash the affected area immediately with soap and water.

● "Keep children away from the work site, and store the container out of their reach."

The developing of the photoresist could easily be performed safely in the backyard after sunset. The photoresist is not so light sensitive that night background illumination would be a problem.

None of the chemicals used in this process should be stored in a refrigerator that contains food, and flammable chemicals should never be stored in any home refrigerator.

With these precautions and common sense, printed circuit boards can safely and successfully be made at home.

Jim Warner
Board of Studies in Chemistry
University of California
Santa Cruz CA 95064

The Wired OR . . . Again!

I read with interest R. W. Burhans' letter (p. 21) regarding the wired OR in the December 1977 *Kilobaud* and would like to inject some word of warning. The wired OR (or, more correctly, wired NOR), when used with TTL devices, should be used *only*, I repeat, *only* with open-collector types. The M²L logic (I love Don Lancaster's term) or diode logic should be used *only*, I repeat, *only* with CMOS devices (which have logic levels much more forgiving than that of TTL) or if the input consists of a switch.

Anybody who follows Mr. Burhans' advice and uses diode isolated AND or OR configurations with normal (totem-pole output) TTL gates of the 7400 or 74LS family is asking for *big* trouble. The reason is simple: The worst-case low-level output voltage for gates of the 7400 family is .4 volts; for 74LS family it is .5 volts. Fast silicon diodes

(like those of the 1N444X family) at a forward current of .1 mA have a static forward voltage of maximal .55 volts (these figures come from the TI manuals).

If now the output of a TTL gate is driving the input of a following gate via a decoupling diode, the low-level input voltage for this gate can be .5 plus .55 or 1.05 volts or even higher, depending on the size of the pull-up resistor. The maximum permissible low-level voltage for all devices of the 7400 and 74LS series, however, is only .8 volts. That means this arrangement operates in a voltage range that is outside of the manufacturer's specifications. The circuit *may* work sometimes, and then it may not work, depending on the whim of the ICs, power buses, temperature and phase of the moon.

That's the reason diode logic with TTL devices having a normal (totem-pole) output should *not*, I repeat, *not* be used (unless, maybe, you are using hot carrier diodes, which have a lower forward voltage but are very expensive, or germanium—remember germanium—diodes, which are slow).

Erich A. Pfeiffer
Granada Hills CA

Ralph Burhans' Reply

The critique of "The Wired OR . . . Again!" is perfectly correct in stating that use of diodes in series with normal totem-pole TTL output (not O.C.) could create problems in excessive zero voltage drop and is not recommended by chip manufacturers. However, experimenters often do what is possible and not what is recommended, particularly if the risk of failure is very small.

Before the widespread use of MSI and LSI, many of us used Don Lancaster's technique (*TTL Cookbook*, Fig. 3-18A, p. 146) where a 74154 decoder is used to address a diode ROM matrix with a lot of NOR intersections. These work quite well, and I don't recall any failures. With the 74LS138 mentioned previously, a two diode NOR with one pull-up resistor provides elegant simplicity driving a D input on a KIM 74LS145 with no problems in my limited experience with four or five different chips.

It is also correct to state that CMOS has essentially no problem . . . so where is the argument? The basic difference in our thinking is perhaps that adverbs like "no" or "only" are applied here with some judgement based

on a typical case (not necessarily the worst case) and experimental trial. I built my first crystal set in 1933 and also know about germanium and use 1N695s if nothing else will work for a "quick and dirty" NOR. Many computer mods, where only a single extra input is needed, can be quickly solved with a single diode, and some of ours have been working for years with no problems.

When designing from scratch, I presently prefer CMOS, but when modifying someone's design, any trick of the trade is valid in my view. Diodes often solve a problem simpler than any other approach. Diode ANDs are still another method where input switching matrices for memory use can be implemented such as in Don Lancaster's *TTL Cookbook* (Fig. 6-27, p. 256).

Ralph W. Burhans
Athens OH

Due Credit

Just received *Kilobaud* No. 16 yesterday; the article was in there. What a good feeling, until I spotted the title block. Oh my!

new 4K EPROM board from SWTP

Credit needs to be given where credit is due.

new 4K EPROM board from APTEC

The goof was not in the proof copy I received because no title block was included.

8080 Simulator Notes

I want to commend your magazine and Lee Stork for a functional and useful program/article on the 8080 Simulator (*Kilobaud*, September 1977, p. 64). After debugging I was able to adapt this program to an Intellect 8/Mod 80, to which I have access. For the benefit of readers who have tried, or are going to try, this program, here are a few notes:

1. At address 134, the mnemonic LSI should be LXI.

2. At address 172, MVI B, 5 was necessary to send a line feed to my console output device (a CRT terminal).

3. Likewise, address 138 needed MVI B, 2 to give me the proper display format.

4. At address 1FD, my ICOM FDOS II assembler creates a

```

OUTPT: IN 1 ;GET STATUS BYTE

     ANI 7FH
     RET

```

Table 1.

machine code of 41,00, rather than the necessary 41,20. This can be rectified if a space follows the A in the source of DW 'A'. It should read DW 'A '.

5. My assembler didn't like the instructions given it on addresses 210-212, it would rather have seen SPACE: DB 20H,20H,20H.

6. Similarly, address 213 assembles to 0A0D, rather than the necessary 0D0A. A source statement fix of DW 0A0DH will straighten that out.

7. As is necessary for most machines, I had to rewrite the I/O routines to conform with the Intel TTY interface card. For those of you who have an Intel 8/Mod 80, the routines are shown in Table 1.

This program is an asset to any hobbyist or programmer who programs in 8080 assembly language.

Rick Beutnagel
Hilton NY

Score 2— For Consumer Computer

In the March 1978 issue of *Kilobaud*, a short article entitled "Consumer Computer, Inc.," appeared. This work describes software, written in North Star BASIC, capable of generating replies to billing form letters produced by large computers employed by giant corporations. The article stated that this software is running on an Imsai 8080 and is being utilized to do battle with one of the largest credit-card companies in business.

Well, the results are in, and Consumer Computer, Inc., lost a few battles but won the war. The form letters generated by the microprocessor were completely ignored by American Express and its overgrown computer system.

This was anticipated, since anything short of enclosing your payment within a ton of cement is usually insufficient to allow any correspondence to escape from the batch-processing syndrome. Therefore, Consumer Computer, Inc., was overcome in its first skirmish. No billing problem was corrected and a fee for the services of Consumer Computer was certainly not collected from the firm issuing the improper billings.

Round two saw "yours truly" taking American Express to New York City's Small Claims Court. Running true to form, American Express failed to answer the summons to appear in court. This caused a judgment to be entered against American Express. The arbitrator, who calculated the amount of the judgment award, allowed an added \$70 for expenses (largely Consumer Computer, Inc). Thus, Consumer Computer, Inc., won an overwhelming victory by correcting my billing difficulties and collecting \$70 from "Goliath," rather than the \$25 fee it was originally hoping to charge American Express for its services.

Beware Master Charge, Visa, Carte Blanche, et al—Consumer Computer is ready to pounce wherever and whenever you make the slightest error by slipping a loose bit in your overgrown computer frame.

Joseph Roehrig
Middle Village NY

"Tiger Trouble" Trouble

This letter refers to the article "Tiger Trouble" (p. 106) in the March 1978 issue. Although the calculator used was not identified, I have assumed that it is either an SR-52, TI-58 or TI-59.

The program as printed on p.

108 contains errors in syntax, especially on line 72, which calls for a function not directly executable on these machines within the number of steps allotted, and on line 63, where no error halt at a "flashing 9.999 999999 99" will occur, at least on the TI-58/59, unless an R/S is provided or flag 8 is set. Furthermore, even after all syntax is corrected for the TI-59, this program will not yield the expected result with a seed of 0.9 given on pp. 108-109.

I suggest that in future articles on TI calculator programs, you specify the calculator model for which the program is intended, and that you provide a copy of the PC-100A program-listing printout, so that no ambiguity in interpretation is possible.

David P. Leising
Grand Rapids MI

It is an SR-56 program, and I apologize for the omission.
—John.

Defective Formula

In the December 1977 *Kilobaud*, p. 24, one of your correspondents suggests the formula $\text{arc sin } X = \text{ATN}(X/\text{SQR}(1-X^2))$. This formula has the defect that when $X = 1$ or -1 , a division by zero is required. Also, when X is close to 1 or -1 , accuracy is impaired through the loss of significant digits in forming $1-X^2$.

I suggest instead the formula $\text{arc sin } X = 2 * \text{ATN}(X/(1 + \text{SQR}(1-X^2)))$. This formula is theoretically exact and preserves the number of significant digits. Also, X^2 usually executes faster and more accurately than X^2 .

The formula $\text{arc cos } X = -\text{arc sin } X + (0.5 * \pi)$ holds in all cases, giving the angle between 0 and π radians.

Charles A. McCarthy
St. Paul MN

Meatless Article

The quality of articles in *Kilobaud* has always ranged from fantastic to restating the obvious, and I have no complaints about this. However, in the April issue, on pages 116, 117, I found the biggest waste of paper I have ever seen in your magazine. Jim Huffman's "Finally: 8080 Meets the Fairchild Video Game" was a farce. It was nothing more than two pages of: . . . 9023, a number not yet given in any data books . . . will release data in a

month or so . . . doing something . . . should be a piece of cake . . . you could add . . . and you would be able to have . . . the schematic . . . was not available . . . at some time in the future will be invaluable. Etc. I am keenly interested in this subject and just wanted to express my disappointment.

H. J. Kuhman
Pittsburgh PA

Once in a while I really blow it, and this was one of those occasions. It was simply my enthusiasm for the subject, and that of many readers, that made me decide to run the article. Thanks for the feedback; I'll try to be more careful.—John.

A Stimulating Response

Thank you for sending our book, *Stimulating Simulations*, to a reviewer who took the time to read the text and actually put the program listings into the computer. Robert Soltysik's statements (*Kilobaud*, April 1978, p. 13), although not in complete agreement with mine, were obviously based on careful examination of the book. His objectivity was certainly a relief after I read a review of *The Devil's Dungeon* in the March issue of *Interface Age*. The *Interface Age* reviewer made statements that indicated he had not entered the program in the computer or even read the scenario carefully. Instead, he vented his hatred for computer games; The Wumpus in particular, on my poor little book, which many readers and publishers have found delightful. Thank you for employing intelligent and conscientious reviewers. The next time I want to communicate with the West Coast, it will be through your magazine.

There was one problem with the review, however. My address and the price of the book were omitted. *Stimulating Simulations* sells for \$5 and can be purchased from Engel Enterprises, PO Box 16612-K, Tampa FL 33687.

6800 Owners: Look Out!

I recently purchased *Practical Microcomputer Programming: The M6800* by W. J. Weller, Northern Technology Books, 1977, \$21.95. I am very disappointed with the book and hope you will not promote it. Here are

my complaints:

1. There are no equipment block diagrams, such as to describe programming models of the MPU, PIA or ACIA. This is a particular disadvantage when trying to describe the behavior of the peripheral chips.

2. There is no description of the hardware interrupt signals, even though there is a chapter on interrupts. Also, this chapter contains inaccurate or misleading statements.

3. The book departs from Motorola assembly language with several pseudo-ops, with some of the number base conventions and with indexed address notation.

4. The book uses no flowcharts to outline or generalize programs.

5. The chapter on floating-point arithmetic could have been written for any computer or microprocessor. It had no real how-to-do-it information and did not even mention any actual floating formats.

I feel that the book is not well organized, but this, I know, is a subjective matter.

Who am I? MSEE with ten years' experience on minis and interfacing. Owner of Altair 680 and MEK6800D2 kit. Instructor (moonlight job) on 6800 system at Midwest College of Engineering. 31 years as W9CUP.

I do like Barden's book (reviewed in January 1978 *Kilobaud*) and the *Scelbi 6800 Software Gourmet Guide and Cookbook*.

More Articles on the 1802?

This is a brief letter of concern directed to your magazine. So far, most of the articles published deal directly with the 6800 series computers or the 8000 series computers. I agree these are popular, however, you seem to overlook the RCA CDP 1802 MPU.

Certainly a large audience exists for this computer, outcropping from the COSMAC Elf series, Netronics Elf II, COSMAC Micro tutor, UC 1800 and the COSMAC VIP. An outlay of only \$100 is needed for a basic computer.

Please publish more articles for the CDP 1802 COSMAC series.

**Mike Otis
Aberdeen SD**

I've said it before, Mike, but you've given me the opportunity to say it again . . . and I thank you. I don't have a magic hat to

reach into and pull out articles on a particular computer. We publish articles that have been written. If you, or any other 1802 owner, would like to see more material on the 1802, then go directly to your typewriter . . . do not pass GO . . . but perhaps you will collect that \$200! You're right about the 1802 gaining in popularity and I'll be happy to see more written about it.—John.

Computer-Portraits Franchise

I read with interest your letter and reply in the letters column of December 1977 on the subject of computer portraits. We are presently setting up a franchise organization that will allow just about anyone to go into computer portraits. The franchise fee will be, not \$7000 to \$10,000, but only \$5000 for everything, including the computer, line printer, TV camera, video monitor and software. We feel this system will have more capabilities than any other system available, and we are dedicated to continually upgrading all units in the field so it will remain so. Anyone desiring more information is invited to write me at Tri Mark Engineering, 12402 W. Kingsgate, Knoxville TN 37922.

**Marshall Dudley
President**

Sounds like a good topic for an article, Marshall.—John.

Demystifying the April Tic-Tac-Toe Program

I'm sorry about the errors in the Tic-Tac-Toe article appearing in the April *Kilobaud*. Basically what happened is:

1. I wrote the article before I had a printer and attempted to type the listings from my video.

2. *Kilobaud* returned a draft of the article. This draft contained numerous errors in the listing (my fault) and pages of program listing were out of order (*Kilobaud* placed page 10 in front of 9).

3. The new proof was sent to me and we still had problems. John Craig and I decided to hold publication of the article until I obtained a computer-generated listing.

4. I sent computer listings writ-

ten in North Star BASIC, since I no longer had Altair equipment. This changed the article drastically.

5. We decided to go with corrected versions of the typed listing so as not to change the article.

6. In the confusion, the necessary corrections were not incorporated and one additional typesetting error was added.

I have no Altair BASIC, so I cannot supply a listing. The corrections are shown in Fig. 1.

Other answers to questions are shown in Fig. 2.

In addition to the corrections, I have attached a North Star listing of a similar 'game' (see below).

Thanks for your understanding.

Taming the I/O Selectric (Part 1)

It's time to get that I/O Selectric you've been using as a typewriter and interface it to your home computer.

Photo 1. The IBM Model 731 Selectric as used in the 1014 Remote Inquiry Unit. The case has an extension on the bottom to house the solenoids, which permit remote operation of the typewriter.

IBM is no longer making the I/O Selectric and as more and more IBM systems are upgraded there will be an increasing number of these units coming onto the surplus market. I've seen several articles on interfacing the Selectric, but I believe this is one of the best. It's very likely the I/O Selectric will become more and more popular as a hard copy device for hobby systems due to its rugged construction (no comparison with an office Selectric) and the cost (\$700 to \$950). The Model 731, which Emerson's article is based on, is mechanically the same as the Model 735. — John.

Last spring I was just getting started in the home computer hobby. I had assembled my SWTPC M-6800 kit and was making my first attempt at programming when it became obvious that any serious work would require a hard copy output. As is the case with all computer hobbyists, I talked about it at

work, and a friend offered me a surplus IBM 1014 Remote Inquiry Terminal, which contained an IBM Selectric Model 731 typewriter. So, here was my hard copy output device; all that I had to do was interface it with my computer.

Well, it's all working now, and I am very happy with it.

It makes beautiful copy. Now I can type assembly listings, use my computer as a text editor and type out letters or articles like this one.

Last January I gave a talk about my Selectric Interface at a meeting of the Computer Hobbyist Group of North Texas, which was received with a lot of interest. Editor John Craig heard about it and suggested an article for *Kilobaud*. So, I am now sitting at my TVT typing words into RAM and printing them out on the Selectric.

The Selectric Interface is presented in two parts: Part one describes the hardware, and part two will cover the software.

More Than a Printer

The 1014 Remote Inquiry Terminal is of early 1960 vintage. The Selectric is mounted on a heavy steel desk, which is full of power supply, relays and diodes. I didn't have room for the desk so I removed the Selectric and discarded the relay encoder and decoder circuitry. That meant that I had to provide everything between the 6800 output and the solenoids in the Selectric. I also decided to give my hard copy printer some extra smarts by arranging for computer control of typewriter on/off, single or double spacing, all capitals or upper and lower-

case letters, and automatic page formatting. This was to be done by means of non-printing control characters, as will be explained in part two.

The Mechanical Marvel

The Selectric typewriter is a mechanical marvel or nightmare, depending on whether it is working right or you are trying to understand how it works and repair and adjust it. The basic typewriter is entirely mechanical except for the electric motor and switch. The characters are selected by tilting and rotating the ball (typing element) to get the proper character in position, and then striking the ribbon and paper with it. The sequence of events goes something like this: The motor drives a pulley through a toothed belt, which drives the operational shaft on the right side of the machine. A series of clutches and cams on this shaft performs the carrier return, line feed, tab, space, back space and shift functions (more about this later). The pulley also drives the cycle shaft on the left through a clutch on the pulley. The cycle shaft drives the filter shaft and print shaft through gears and does the print function.

When you press a key, an interposer is pushed down so that it trips the cycle clutch to start the print mechanism. It is also positioned so that a blade on the filter shaft strikes it and pushes it forward. The interposers, a different one for each key, have teeth that push against six selector bails. The selector bails in turn push latches from under a latch bail that is being pushed down by cams on the cycle shaft. If the latches are left hooked, the latch bail will operate a mechanical differential mechanism that moves pulleys to pull on the steel tapes. These tapes are wrapped around two drums which rotate and tilt the type element. If the six latches are hooked, they produce rota-

tion of one unit (R1), two units (R2) and two units (R2A) to the right, and tilt of one (T1) and two (T2) units. The five-unit rotation (R5) is an exception. Latching prevents five units of rotation to the left. Combinations of these latches can then print any of the 44 characters on half of the type element (four rows with 11 characters per row). The shift operation turns the ball 180 degrees so that the characters on the other half of the ball can be printed.

Though all this may sound like a Rube Goldberg machine, it is really a carefully designed device, with interlocks to prevent improper operation if the operator presses two keys at once, or if there are other timing problems. Long trouble-free service is obtained through wear-adjusting compensation. You have to take your hat off to the Selectric designers.

You don't have to understand all this to get the point — to control the Selectric by the computer, all you have to do is provide solenoids to control the latches. Similar solenoids can control the clutches for space, back space, carrier return, line feed, tab and shift. My Selectric had all of the solenoids except for the shift. If yours doesn't, and you have a little mechanical ability, you should be able to add solenoids made from old relays. Before you start, be sure to get a copy of the service manual for your typewriter. Manuals and repair parts can be obtained through your local IBM office or through an IBM Parts Distribution Center, which, in major centers like Dallas, provide 24-hour service at fair prices.

How Many Control Lines?

There are 13 Selectric functions, so it would seem

Photo 2. The type element is visible on the carrier. The carrier rides on the print shaft, which is driven by gears on the left side. The 11-inch platen has pins for paper drive.

Photo 3. The belt drive is in the center of the photo. To the left of the drive pulley are the cycle clutch, five-unit cam, selector cam and reset cam on the cycle shaft. To the right is the operation shaft with the shock release clutch, carrier return clutch and pinion, tab governor and pinion, space and back space clutch and cam, and carrier return and index clutch and cam. The shift mechanism is on the right end of the operation shaft.

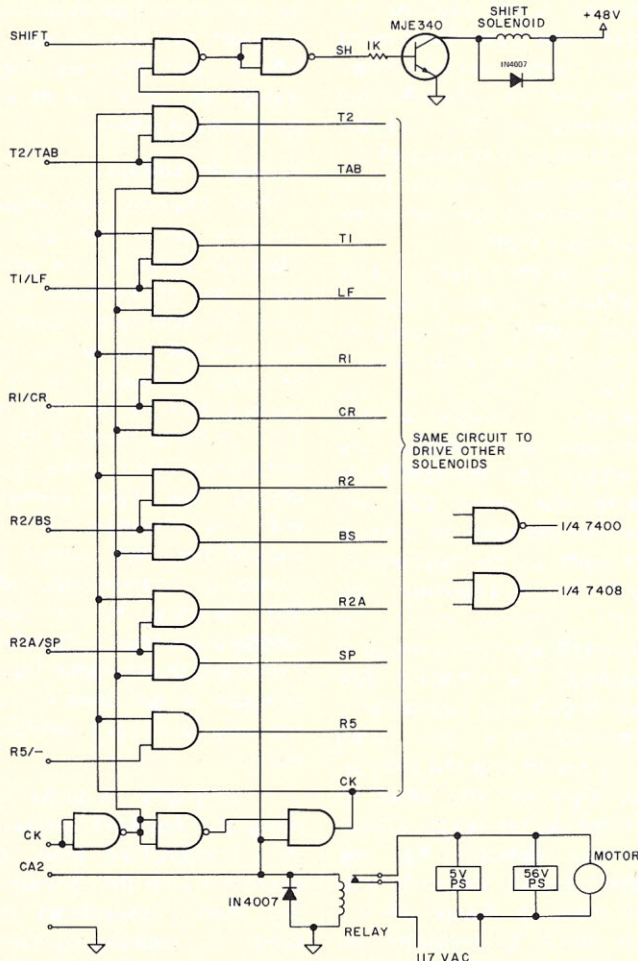

Fig. 1. Interface circuit diagram.

that 13 control circuits from the computer would be required to control the typewriter. However, when the typewriter is typing a character only the seven type element control functions, R1, R2, R2A, R5, T1, T2 and CK (trip the cycle clutch), and SH (shift) may be required at the same time. The next five functions, SP (space), BS (back space), CR (carrier return), IND (index = IBM for line feed) and TAB (tabulate), do not need any of the type element control functions. This allows a line-saving multiplexing scheme to be used. As shown in the

circuit diagram (Fig. 1), the CK line that is always on when a character is being typed is used to control the electronic equivalent of a six-pole double-throw switch. When CK is on, the type element control functions are connected to the computer. When CK is off, the non-printing functions are connected.

The shift function must not change during a character typing operation and is provided a control line of its own so that it may be controlled separately from the other functions.

With this interface cir-

cuitry, all of the functions of the typewriter can be controlled. For example, to do a line feed, binary 00100000 or hex 20 should be the output to the typewriter. To type a capital A requires shift up, tilt two units and rotate left two units. The typewriter then requires binary 10100111 or hex A7. If the typewriter was in a down-shift condition, a binary 10000000 or hex 80 would be required to shift up before sending the typewriter the A7 to type A. As soon as the typewriter has started the type operation, the output should be changed to 80 to hold the up-shift condition but allow resetting of the latches to prevent typing a string of AAAAAAAAA. Now, if a hyphen is to be typed, shift down, tilt three and five right rotation are required. Before typing, 00 would be sent to the typewriter to

cause down shift. Then binary 00000001 or hex 01 would cause "-" to be typed. Following this pattern, you can make up a table of typewriter codes for all of the characters on the type element just by noting what shift, tilt and rotation is needed.

Turning on the typewriter and the power supplies is a little different because the switching circuit can't work with the power supply off. To get around this I used the CA2 handshake control line to directly operate a relay (Radio Shack #275-004). The power relay applies the 115 V ac to the typewriter motor, the 5 V and 56 V power supplies.

The solenoids in the typewriter require about 48 V dc at about 100 mA to operate reliably. This is too much for the usual TTL device, so a driver circuit is required. I

used surplus Motorola MJE340 Darlington transistors, one for each solenoid. All of the solenoids in the typewriter were disconnected from the original circuit, and reconnected with common leads to the +56 V supply. The transistor collector was connected to the other terminal of the appropriate solenoid, with a 1N4007 diode to protect the transistor from the solenoid fly-back voltage. (A similar fly-back protection diode is provided with the power relay.) The transistors are driven directly from the TTL ICs with a series 1k Ohm resistor to limit current. The power supply is 56 V to allow for voltage drop in the transistors and supply 48 V to the solenoids.

The solenoids in the typewriter operate trip-type mechanisms — that is, when a solenoid is energized it trips a latch, and then even if the solenoid is turned off, the function is still enabled. To prevent the typewriter's being left in some unknown character condition, the CA2 line interlocks the CK and SH functions so that none of the type element control functions can be tripped while the typewriter is off.

My Selectric had no shift mechanism when I got it. Since a shift is necessary to get all the desired characters, I had to add it to the machine. I bought all the necessary parts except the solenoids from the IBM Parts Center for about \$20 and used an old relay to operate the shift clutch mechanism. With this arrangement, the shift circuit must be energized whenever shift-up is required. The standard IBM shift circuit uses two latching solenoids with one being energized to trip the shift-up condition and the other to trip the shift-down condition. If your Selectric has the standard shift solenoids you will want to change the circuit shown by providing another transistor to operate the second shift solenoid and

two one-shots with about 20 milliseconds on time to drive the two shift solenoids. The shift line switching on should then trigger the up-shift one-shot and when the shift line switches off the down-shift one-shot should be triggered.

The 5 V power supply is a 1 Amp regulated supply I got in a kit. The 56 V supply was made from a surplus 40 V 1 Amp transformer, bridge 1 Amp rectifiers, a surplus 1000 uF 100 V filter capacitor, but no regulator.

The interface circuitry was built on Vector .1 inch perforated circuit board and with a Vector wiring pencil and solder-through wire. All of the circuitry and power supplies were mounted on a plastic cradle in the space under the typewriter mechanism, as shown in the photo. The third transformer was required because my typewriter motor turned out to be a 208 V motor. I found a 75 V 1 Amp surplus transformer, which I connected up to boost the line voltage to 190 V, and that was high enough to make the motor start and run properly.

Timing By Software

The Selectric had many contacts on it for use as character input to the computer and as feedback contacts for timing purposes. I had decided not to use the Selectric keyboard for two reasons. First, I felt that the TVT terminal made a more convenient input device, and second, the type element with the characters that I wanted bore no relation to keyboard arrangement. My 731 Selectric has a non-standard keyboard. Therefore I removed the character input contacts to get them out of the way and make servicing easier.

I originally thought of using the feedback contacts in a handshaking mode of operation with the computer. But then I considered the need to maintain contacts, the added interface circuitry required and the possibility

Photo 4. A view of the underside shows the seven selector solenoids at the left rear. These push the latches from under the latch bail for character selection. The vertical bars at the front under the keyboard are the interposers, and the horizontal bars are the selector bails mentioned in the text. On the right side are the five operation solenoids for space, carrier return, etc. Below these is the relay I added to trip the shift mechanism. The solenoid near the middle is a keyboard lock-out which I have not used. The typewriter mechanism sits in a plastic cradle, which serves as a mounting for the parts for the electrical interface.

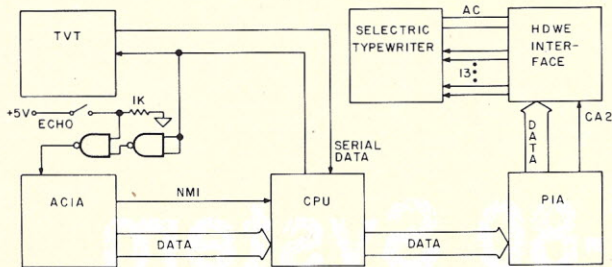

Fig. 2. System block diagram.

of the computer's hanging up waiting for a missing contact closure because of grease, dirt or other problems. Open loop software timing by the computer looked pretty good, and as it has turned out it was a trouble-free choice.

In order to do the software timing, you have to know accurately the time required for each function, or allow extra time for the uncertainty and thus slow down the output rate.

The basic timing comes from the rotation of the operational shaft, which turns at $7\frac{1}{2}$ revolutions per second. When the cycle clutch is engaged to type a character it turns at the same speed as the operational shaft. The cycle shaft cams are double lobed, and so type a character in half a revolution. This means that the basic maximum typing speed is 15 characters per second (or 67 milliseconds per character), which is pretty respectable. The pull-in time for the solenoids is appreciable, about ten milliseconds. However, all of the typewriter functions are initiated by solenoids; so this common time doesn't have to be counted, as far as the software timing is concerned, because the pull-in time can overlap the completion of another function.

Shift up or shift down must be done as a separate function, and not while typing a character. A half revolution of the operational shaft is required for either shift up or shift down ($1/15$ second or 67 milliseconds).

Space and back space are also done in half a revolution of the operational shaft, but

with a difference. The cycle and shift clutches are wrap-up spring clutches, and take hold almost instantly. The space, back space, carrier return and line feed clutches are sprocket-and-dog clutches, the sprocket having nine teeth. This means that there is a $1/9$ operational shaft revolution time uncertainty or 15 milliseconds in the time for these functions. For this reason, the space and back space functions are allowed 81 milliseconds.

Line feed requires a full turn of the operational shaft and gives a time of 148 milliseconds when the clutch uncertainty is added. The time required for carrier return is dependent upon how far the carrier has to travel. I allowed 525 milliseconds for the carrier return — enough for an 80-character line.

Where Do You Plug It In?

There are ten wires going to the typewriter — eight for typing functions, one for the power relay, and a common ground. These connect to an MC6820 peripheral interface adapter (PIA) in the computer: the eight control lines to the data output PIA terminals and the power relay line to the CA2 terminal. Then the computer only has to put the proper outputs to the PIA to control the typewriter.

I thought the easiest way to interface the typewriter to the program requiring hard copy output would be to have the typewriter echo what is being written on the TVT screen, thus requiring minimum modification of existing programs. The sys-

Photo 5. On the left is the 56 V power supply to operate the solenoids. The other large transformer is to adapt the 208 V motor to the 117 V power. The circuit board with the transistors, diodes, and the ICs that control the solenoids are mounted on the bottom of the cradle beneath the power relay. The 5 V power supply is at the rear.

Photo 6. The shift clutch, cam, and solenoid had to be added to my machine. The shift cam pushes out the arm with the pulley on the upper end, which pulls the rotate tape to turn the type element 180 degrees.

tem block diagram (Fig. 2) shows how this was done.

Two NAND gates (7400) were connected in cascade, with the ECHO switch tied to one of the inputs of the second gate. The two inputs of the first gate connect to the serial data line from the computer to the TVT. When the ECHO switch is on, the output of the second gate echos the serial data going to the TVT. When that switch is off, the output is high or mark. The output is connected to the serial input terminal of an MC6850 asynchronous communications interface adapter (ACIA). With the echo switch on,

when a character has been sent to the TVT and the ACIA has received it, the ACIA interrupts the computer through the nonmaskable interrupt line (NMI). The computer takes the character from the ACIA receive buffer, converts it to the proper control byte for the typewriter and puts the byte out to the PIA. After the proper time delay for typewriter operation, the computer is returned to the main program.

The software that does all of this and controls the Selectric typewriter will be described in part two of this article. ■

Home-Brew Z-80 System (Part 1)

If you want to build your own system from scratch, just follow these instructions.

Due to the informal nature of Kilobaud, we don't normally provide an author's profile with each article... or even discuss an author's background. With Norm Thagard, I'm going to make an exception. Norm was one of 8079 applicants for America's next generation of astronauts... the NASA Mission Specialists who will be going into orbit aboard the Space Shuttle. When the competition got narrowed down to 208 aspirants Norm called me on the phone and told me he wanted to use the fact that he had built a home-brew computer system, and published an article on it, as additional leverage with NASA. Maybe it helped, because he was one of the 35 selected for the mission-specialist slots. Congratulations... and the very best to you, Norm.—John.

The availability of several low-cost S-100-compatible Z-80 CPU boards, the high cost (for a medical student) of commercial S-100 systems and a burning desire to have a personal Z-80 system prompted me to design and construct a front panel that provides the logic to use the commercial CPU boards in an otherwise home-brew system. In my case, the S.D. Sales Z-80 CPU card was available locally and was the starting point for the design.

Lacking software experience with the Z-80, I needed a software-independent unit. Indeed, one of my major goals was to have a system with which I could develop software. The result was a manual front panel permitting direct access to memory for both read and write operations.

Armed with the Z-80 technical manual and the schematic of the S.D. Sales CPU card, I began the design. The outgrowth of the effort is depicted in this article.

Design Considerations

There were several things I

especially wanted from my system: First, compatibility with the many commercial S-100 peripherals available. Since I was using the commercial CPU card, this aim was easily met—I only had to avoid compromising what was already there. Second, an expandable system—up to 64K of memory and I/O ports galore. Basically, this meant the use of Tri-state buffers in an expandable bus configuration.

Also, I wanted to use, wherever possible, standard TTL chips that I had pulled off old boards at an average cost of three or four cents. I wanted to avoid, at all costs, the use of special devices. However, in the interest of reducing bus loading and parts counts, I was willing to use some low-power Schottky packages.

I was also willing to sacrifice the dynamic refresh capability of the Z-80 to take advantage of a straightforward method of front-panel operation. This method is called direct memory access (DMA) and is readily implemented with the Z-80 MPU. Dynamic memory could still be

used but would require the use of an external refresh circuit.

My home-brew TVT is entirely stand-alone with off-line capability; so I did not care that DMA by other devices, such as DMA requiring TVTs, would not be possible during front-panel operation. This would not be a serious disadvantage considering the normal reason for using the front panel, that is, for small program development and/or bootstrapping tape programs into memory. With data latches and additional logic, it would be possible to restore full DMA operation. Single-step operation is a nice feature permitting you to go through a program op code by op code. This is very handy for debugging software and, fortunately, very easily implemented.

Theory of Operation

DMA is possible with a Tri-state bus system and some means to suspend MPU operation. On the Z-80 chip is a pin labeled $\overline{\text{BUSERQ}}$. It might better be named $\overline{\text{DMARQ}}$ because bringing this pin low forces the MPU to set its address, data and Tri-state output control signals to the third, or high-impedance state, thereby facilitating DMA operation. In our case, switch S3 (Fig. 1) is debounced and forces $\overline{\text{PHOLD}}$ low, which is applied through a Tri-state buffer at the CPU card to pin 25 of the Z-80 MPU (Fig. 2). As soon as the current machine cycle is ended, the MPU grants the request and acknowledges the grant by

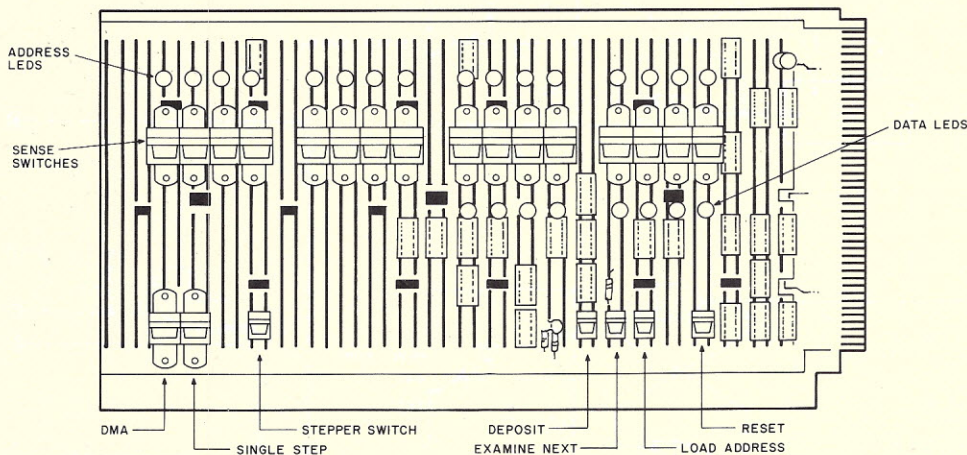

bringing $\overline{\text{BUSAK}}$ low. On the CPU card, this signal is inverted to become the S-100 signal PHLDA (DMAG or DMA grant).

If the front panel has requested the DMA, the address bus is controlled by 74193 counters through Tri-state buffers ICs 15 to 17. At the same time, control of the data-out bus is made possible should a front-panel write operation ensue. Finally, the CPU card Tri-state buffers are disabled by the active low signals $\overline{\text{CC DSBL}}$, $\overline{\text{DO DSBL}}$, $\overline{\text{SDSBL}}$ and $\overline{\text{ADDRDSB}}$.

ICs 19 to 21 are depicted as 74LS368 Tri-state buffers, but could be 8T98 or 8098 types as direct replacements. However, the 8T98 will draw more current and the 8098 will represent a larger load to the bus. Alternatively, 7404, 7405 or 7406 types could be used with a different pin-out and higher bus loading. The 74LS04 cannot be used because it will sink only eight mA in output low state. A bit that is at logic one will cause the indicator LEDs to be forward biased and the 10 or 12 mA should give adequate light output.

To load the address, set the 16 sense switches, SS0 to SS15, to the desired location and toggle the LOAD ADDRESS switch S7. This brings the load pin on the four counters, IC11 to 14, low, which latches the address. Then this address appears at the Q outputs and at the address bus via the buffers.

To increment an address already loaded, toggle the EX-

Results of my efforts.

AMINE NEXT switch S5, which is debounced and applied through IC7a to pin 5 of IC11. Note that the increment does not occur until S5 is released. This is because the 74193 counts up on a zero-to-one transition, which does not occur until S5 is released.

Access to the data-out bus is through buffers IC17 and 18. These buffers are activated only during a write operation. After the desired address is loaded, the data is set by sense switches SS0 to SS7, which do double duty as data and low-order address byte switches. With the data set, the DEPOSIT switch S4 is activated. If DMA has been granted to the front panel, the debounced toggle passes through IC7b to IC9a, a one-shot. The one-shot places the data on the data-out bus by enabling IC17 and 18 and triggers the write pulse generator IC9b. At the end of the data-

enable pulse from IC9a, the address counters are incremented automatically to access the next sequential location.

The data-in bus is continuously monitored by the inverter/LED circuitry of IC6 and 22. Here, 7404 types are used because there is little need to reduce loading on a bus that usually communicates only with the CPU.

If a program has been loaded into memory, it will execute, starting at location 0000₁₆, by returning the DMA switch to RUN and then depressing the RESET switch S6. If the CONTINUOUS/SINGLE STEP switch S1 is in CONTINUOUS mode, the execution will continue until a software HALT, 76₁₆, is encountered or DMA is requested and granted. If SINGLE STEP mode is selected, each op code must be executed one at a time by toggling the STEPPER

switch S2. This switch is debounced and clocks in a logic one to the D flip-flop IC2a. This, in turn, allows PRDY to go high via IC4c and 10. PRDY communicates with WAIT on the Z-80 MPU. As long as WAIT is held low, the Z-80 will continue to "spin its wheels" by executing wait states.

Activating the STEPPER switch allows the Z-80 to resume normal operation until the next instruction-fetch cycle comes up. When this happens, the Z-80 signals the event by bringing its M1 pin low. This signal appears inverted as SM1 on the S-100 bus and will trigger the one-shot IC1. In turn, IC1 clears the flip-flop once again, bringing PRDY low and throwing the Z-80 back into neutral until the next STEPPER switch toggle.

One change should be made on the S.D. Sales CPU card. IC20 should be removed from

its socket. Bend pin 11 outward carefully and replace the IC (be careful that pin 11 remains outside the socket). If other Z-80 circuit boards output the machine cycle state M1 on bus line D05 (S-100 bus line 39) during PSYNC, it may be necessary to disable this feature in a similar manner. Otherwise, attempts to load memory from the front panel may result in errors in bit 5 as two Tri-state devices fight each other for control of that bit.

Construction

Because of a fortuitous circumstance (low price and availability), my front panel was constructed on a large prototyping board with excellent ground and power buses. Either this sort of board or an S-100 prototyping board is recommended. If the S-100 board is used, you can simply take a standard aluminum chassis of appropriate size, mount the desired number of S-100 edge connectors on top of the chassis, hand-wire the connectors together and place the front-panel board in the forwardmost edge connector. (The pin connections on the diagrams reflect S-100 bus signals.)

A PC board is really not very practical. It would be tedious to design and would not be suited for the inevitable modifications that home-brew enthusiasts are prone to make. Wire-wrap and wiring pencil are the two techniques usually employed; I used the latter. Layout is by no means critical, and I actually used no bypass capacitors except for 50 uF electrolytics at the points where Vcc entered the board. However, good practice (according to Don Lancaster's *TTL Cookbook*) calls for one 0.01 to 0.1 uF ceramic capacitor per four gate packages or per two MSI packages. When using a wiring pencil, it is a good idea to check continuity of each interconnection with an ohmmeter.

You may generally follow the layout shown in the accompanying photograph or change it to suit your own inclinations.

A word of advice: the DEPOSIT, EXAMINE NEXT and STEPPER switches will be frequently used and should be conveniently placed. The sense switches can be grouped in fours as shown for hex notation or in

threes for octal. Although space requirements may tempt you to place the sense switches as close together as possible without grouping them, don't do it! With such an arrangement your error rate will

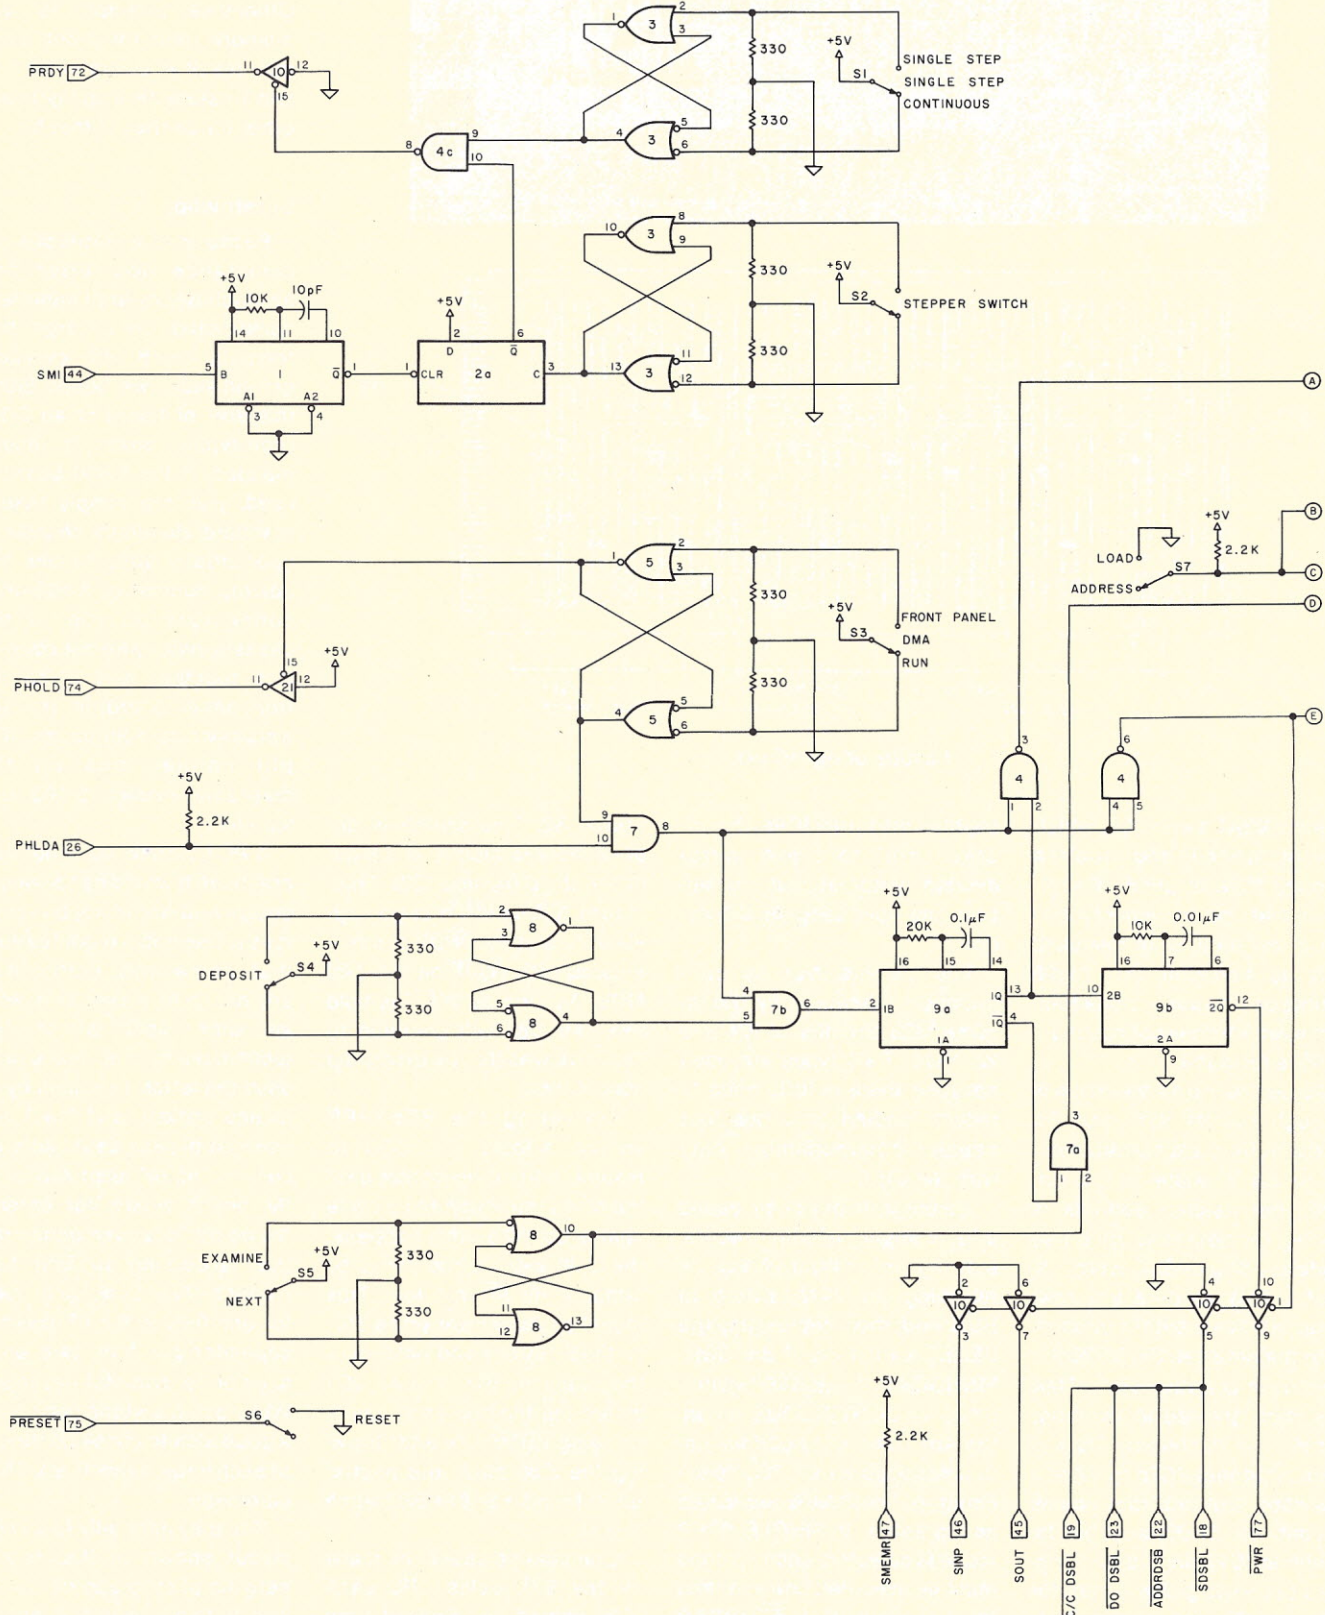

be phenomenal.

Checkout

Prior to applying power, use your ohmmeter to ensure that no Vcc-to-ground short exists. The supply connections to the

ICs in this project are all "at the corners," as is standard with TTL, so make sure they are connected to the appropriate bus.

With no other device in the system, power up the front panel. It should draw about 1

Amp at 5 V dc depending on how many LEDs are illuminated. With a voltmeter, check the enable pins of the Tri-state buffers of the address and data-out buses. These pins should be in the disabled or

high level. If this is the case, then it should be safe to plug in the CPU and memory cards. Be sure to remove power before inserting these cards, and bear in mind that the commercial boards require +8 V dc un-

regulated and have on-board regulators.

You can now perform a quick checkout and run a simple program at the same time. The program will add two binary numbers and store the result in a

memory location where it can be examined.

1. Set DMA switch to DMA mode and SINGLE STEP switch to CONTINUOUS mode. It may be necessary to activate the RESET switch to get a DMAG

SS0-15	SPDT toggle switches

Parts list.

from the CPU.

2. Set up address 0000₁₆ on sense switches SS0 to SS15 and load this address by toggling LOAD ADDRESS. All address LEDs should extinguish. Remember, all Z-80 programs must begin at zero on start-up.

3. Using SS0 to SS7, set up data byte 3E₁₆(00111110₂) and enter this byte into location 0000₁₆ by toggling DEPOSIT. The address LEDs should now indicate 0001₁₆. 3E₁₆ is the Z-80 op code for load accumulator immediate, and its execution will cause the byte in location 0001₁₆ to be placed in the accumulator register of the MPU.

4. DEPOSIT 08₁₆. The address should now read 0002₁₆.

5. DEPOSIT C6₁₆. This is the op code for add accumulator immediate and will result in the addition of the byte stored in the next sequential memory location to the contents of the accumulator. The result will remain in the accumulator.

6. DEPOSIT 08₁₆. This number will be added to the 08₁₆ already in the accumulator.

7. DEPOSIT 32₁₆. This is the op code for load memory immediate and will cause the contents of the accumulator to be

stored in the location in memory specified by the next two program bytes.

8. DEPOSIT 10₁₆. The low-order byte of a two-byte address is specified first in a Z-80/8080 system. In a 6800 system, the high-order byte is specified first. In our case, the address in which the accumulator contents are to be stored is XX10₁₆, where XX is specified in the next memory entry.

9. DEPOSIT 00₁₆. The high-order byte of our storage address is now specified to be 00₁₆. The complete address is 0010₁₆.

10. DEPOSIT 76₁₆. This is the op code for a software HALT; its execution will halt the MPU, causing it to execute NOPs (no ops) until interrupted or reset. The indicated address should now be 08₁₆.

11. LOAD ADDRESS 0000₁₆. The data LEDs should indicate 3E₁₆. Using EXAMINE NEXT, toggle through the first seven memory locations to verify the program you have just entered.

12. Place the SINGLE STEP switch in the SINGLE STEP mode, return DMA to RUN mode and activate the RESET.

The address indicators will show 0000₁₆ and the data LEDs will display 3E₁₆. Activate the STEPPER switch once. The address will now be 02₁₆ and data will be C6₁₆. Address 0001₁₆ will appear to have been skipped but, in fact, will have been accessed and 08₁₆ will have been loaded into the accumulator. As the MPU does not enter wait states until instruction-fetch cycles occur, it will always appear to skip certain locations. Continue toggling the STEPPER switch until the HALT instruction is encountered.

13. Now return the DMA switch to DMA mode and then move the SINGLE STEP switch to CONTINUOUS. LOAD ADDRESS 0010₁₆ and the result of the addition, 10₁₆, should appear on the data LEDs.

14. DEPOSIT 00₁₆ in location 0010₁₆. Try now to execute the same program in CON-

TINUOUS mode by moving the DMA switch to DMA and toggling RESET. The address indicator will show 0008₁₆, indicating that program execution is complete and the MPU has halted. Return the DMA switch to DMA and LOAD ADDRESS 0010₁₆. The result, 10₁₆, should once again appear on the data LEDs.

Conclusion

This article has described a simple manual front panel that can be combined with commercial S-100 Z-80 CPU boards to provide a working Z-80 computer system. This will allow the user to bootstrap tape programs into his machine and to develop simple routines. It is an excellent way to experiment and familiarize yourself with the Z-80 instruction set. It is probably the cheapest way to assemble a working system. ■

Introducing Bit Pad.

The new,
low-cost digitizer for
small computer systems.

Bit Pad is the newest product from Summagraphics, the leading producer of professional digitizers. It has a small 11-inch active area and a small \$555 price tag. But the list of applications is as big as your imagination.

Better than a joystick or keyboard for entering graphic information, it converts any point on a page, any vector, any distance into its digital equivalents. It's also a menu for data entry. You assign a value, or an instruction to any location on the pad. At the touch of a stylus, it's entered into your system.

Who can use it? Anyone from the educator and the engineer to the hobbyist and the computer games enthusiast. The data structure is byte oriented for easy compatibility with small computers, so you can add a power supply, stand-alone display, cross-hair cursor and many other options.

\$1,000.00 creativity prize. You can also add \$1,000.00 to your bank account as a reward for your inventiveness. Just write an article on an original Bit Pad application and submit it to any national small-computer periodical. If the editors publish it -- and the decision is solely theirs -- Summagraphics will pay you \$1,000.00. Contact Summagraphics for rules concerning this offer.

A Strategy for Healthy Living

This computerized exercise/fitness program provides a systematic approach to getting—then staying—in shape.

AI's exerciser program has laid the groundwork for some really exciting possibilities. The next step is to have an analog-to-digital pulse counter so the computer can monitor the pulse continuously. And, along with that, speech output so the computer can tell you (as you exercise) if the pulse rate is high or low! — John.

*AI Gerbens
1038 E. 6th Pl.
Mesa AZ 85203*

Recently, in the process of surviving that ordeal known as a physical examination, I was introduced to a

book entitled *Total Fitness in 30 Minutes A Week* by Morehouse and Gross (Simon and Schuster, NY, 1975). I later purchased a copy, read it and began following much of the advice and direction it contains. Very briefly, building and/or maintaining

physical fitness is accomplished using three ten-minute exercise sessions per week. During each of these sessions you monitor your pulse rate and attempt to maintain it near a predetermined value. Each session requires more work to produce the same pulse rate as your condition improves.

Timing the segments in each ten-minute session and timing six seconds to obtain a pulse count turned out to be a pain in the neck. For example if you begin at 06:59:22 and time one minute, then you should stop at 07:00:22 and then begin timing the next two minute segment. It's now 07:02:22 and time to check pulse rate for six seconds while counting the beats. Then multiply the pulse count by ten in order to get the rate, and begin another two-minute countdown at 07:02:37. Let's see ... adding two minutes gives 07:04:37. ... It's really not all that complicated until you try it while concentrating on the exercises. I thought that programming our microcomputer to assist in timing and pulse rate determination would be an interesting application. Here is the result.

Exercise Program Functions

The program listed provides the functions of:

1. Reviewing the major concept of utilizing pulse rate as an effectiveness indicator.
2. Displaying the exercise sequence.
3. Calculating and displaying your training pulse rate based on your age.
4. Displaying that segment of exercise sequence to be accomplished next.
5. Timing each segment while displaying segment elapsed time on a video display in five-second increments.
6. Indicating when pulse rate determinations should be made.
7. Accepting 15 pulses that correspond to heartbeats, and

RUN

EXERCISER

THIS PROGRAM PROVIDES THREE FUNCTIONS RELATED TO THE FIRST LEVEL EXERCISES DESCRIBED IN -TOTAL FITNESS IN 30 MINUTES A WEEK-BY L.E. MOREHOUSE.

THE THREE FUNCTIONS ARE SEQUENCE, TIMING AND PULSE RATE DETERMINATION.

TO CHECK PULSE RATE, FIRST LOCATE YOUR PULSE BY PRESSING AN INDEX FINGER AGAINST ONE TEMPORAL ARTERY AT THE SIDE OF YOUR FOREHEAD,(TEMPLE). USING THE OTHER HAND SHARPLY PUSH THE BUTTON IMMEDIATELY FOLLOWING EACH HEART BEAT. IF CORRECTLY ENTERED A SINGLE NUMBER WILL APPEAR ON THE SCREEN.

AVOID HOLDING THE BUTTON DOWN TOO LONG. MULTIPLE ENTRIES CAN RESULT.

15 BEATS WILL BE ENTERED AND THEN YOUR PULSE RATE WILL BE AUTOMATICALLY DISPLAYED.

THE EXERCISE SEQUENCE IS

- 1) LIMBERING UP(1 MIN)
- 2) MUSCLE BUILDUP(4 MIN)
- 3) CIRCULO-RESPIRATORY CONDITIONING (5MINS)

THE REFERENCED TEXT SHOULD BE READ BEFORE PROCEEDING FURTHER.

WHAT IS YOUR AGE? 34
YOUR BEGINNING TRAINING PULSE RATE IS 111 BEATS PER MINUTE.

BEGIN WITH ONE MINUTE OF LIMBERING EXERCISES, SUCH AS

- 1) STRETCHING
- 2) TWISTING
- 3) BENDING

EASY DOES IT. LIMBER UP SLOWLY.

START
5 SECONDS
10 SECONDS

[ETC.]

60 SECONDS
ONE MINUTE

NEXT UP, 4 MINUTES OF MUSCLE EXERCISES TO ADD MUSCLE TISSUE. DO 15 PUSH AWAYS AND THEN 15 SITBACKS IN APPROXIMATELY THE NEXT TWO MINUTES. THEN CHECK YOUR PULSE RATE.

[COUNTDOWN TWO MINUTES FIVE SECONDS AT A TIME]

NOW LETS CHECK YOUR PULSE RATE. PRESS THE BUTTON AFTER EACH BEAT. KEEP MOVING!
PROCEED WHEN YOU ARE READY

1
2
3

[ETC.]

15
THANK YOU
RATE = 120 BEATS/MINUTE
GOOD, WITH A PULSE RATE OF 120
YOU CAN NOW REPEAT THE PUSH-AWAY AND SITBACK EXERCISES. 15 TIMES EACH; TAKE ABOUT 2 MIN.

[COUNTDOWN TWO MINUTES FIVE SECONDS AT A TIME]

NOW LETS CHECK THAT PULSE RATE.

PRESS THE BUTTON AFTER EACH BEAT. KEEP MOVING!
PROCEED WHEN YOU ARE READY.

1

2
[ETC.]

15

THANK YOU
RATE = 123 BEATS/MINUTE

SELECT ANY EXERCISE SUCH AS RUNNING IN PLACE. THE OBJECTIVE IS TO GET YOUR PULSE RATE UP TO 111 BEATS/MINUTE AND KEEP IT THERE FOR ABOUT FIVE MINUTES. BEGIN EXERCISING AND CHECK YOUR PULSE RATE IN ONE MINUTE
START

[COUNTDOWN ONE MINUTE FIVE SECONDS AT A TIME]

PULSE RATE CHECK AGAIN
PRESS THE BUTTON AFTER EACH BEAT. KEEP MOVING!
PROCEED WHEN YOU ARE READY

1

2

[ETC.]

15

THANK YOU
RATE = 153 BEATS/MINUTE
AT 153 BEATS/MIN. YOU SHOULD SLOW DOWN. CUT YOUR EXERCISE RATE TO ABOUT ONE HALF OF WHAT IT HAS BEEN FOR THE LAST ONE MINUTE. NOW CONTINUE EXERCISING FOR THE NEXT TWO MINUTES.

[COUNTDOWN TWO MINUTES FIVE SECONDS AT A TIME]

TIME FOR ANOTHER PULSE RATE CHECK. PRESS THE BUTTON AFTER EACH BEAT. KEEP MOVING!
PROCEED WHEN YOU ARE READY

1

2

[ETC.]

15

THANK YOU
RATE = 130
LETS CONTINUE. TWO MINUTES REMAIN IN THIS SESSION.

[COUNTDOWN TWO MINUTES FIVE SECONDS AT A TIME]

THIS SEQUENCE SHOULD BE REPEATED THREE TIMES PER WEEK. SEE YOU IN TWO OR THREE DAYS.
READY

Sample run.

alone. Grounding one of these lines produces an input different from 255, and the program drops into another loop. You can momentarily ground one of the port one input lines by using a push button attached to a ten-foot cord, which allows you to move around during the pulse rate determination. It is important not to stand perfectly still during this process. According to the book, passing out cold is a possible consequence of remaining still immediately following exercise, and my computer's bag of tricks does not yet include administration of smelling salts or respiration-assistance capability. Enter each heart-beat as you feel it with one hand by momentarily pushing the button with the other hand. To feel your pulse, lightly press an index finger against one of your temporal arteries (located in the temple area of your head). *Never press both arteries simultaneously.*

To help prevent multiple entries caused by holding the button down for too long, each beat is displayed on the video screen as it is recorded. Try it a few times; it won't take long to get the hang of it. If you have trouble, two solutions are potentially helpful. 1. Increase the timing of the counting loop by changing the software. 2. Add some hardware in the form of a nonretriggerable one-shot between the push button and the input port.

Counter Calibration.

Each time through the counting loop, the variable T is incremented. Calibration was not as easy as I expected, however, because the relationship between pulse rate and T turned out to be non-linear. After collecting a few data points and cranking them through linear and exponential curve fit routines, I obtained a 99.8 percent fit using the power curve $Y=AX^B$ line fit routine on an HP-65 programmable calculator. Realizing a lot of people don't have access to this resource, I've written a routine in BASIC that you can enter into your micro-computer for calibration of the counting loop on your system. Here's how to use it:

1. Enter the exerciser program, or just the counting loop if you prefer.
2. Collect three or more data points by entering known rates, which can be generated by carefully watching the sweep second hand of a clock. One pulse each second is 60 beats per minute, two pulses each second is 120 beats per minute and one pulse each two seconds is 30

beats per minute. Collect the value of T each time after the routine has counted 15 beats. Repeat each input rate about ten times and use the best eight determinations, throwing out the highest and lowest T value determination per rate.

3. Now enter the calibrating program listed with this article. It will ask you how many data points you have and then will ask you to input the values you have collected. The program then performs a line fit routine, matching the points to the general formula $Y=AX^B$, and generates a formula for a line on which the points fall. It then converts this formula into the format required in line 308 of the exerciser program. Watch R2; it is a goodness of fit value, and if it's not between .94 and 1.0, something is amiss.

4. Enter the output as line 308 in the exerciser program, and you're calibrated. Each time you enter a T value, a

B1 or heartbeat rate value will be calculated using that formula.

An alternative is to collect enough data points to build a lookup table into the program or alter the counter loop to produce a linear correlation.

The program occupies about 4.5K of RAM and is written in D.G. Maxi-BASIC Version 1.0. It is running on a Digital Group Z-80 system with a 2.5 MHz clock and 18K of RAM.

This is a unique application of a microcomputer in the home. Automatically inputting the heartbeat data using sensors such as strain gauges or force transducers is the next step. That's a hardware problem of no small magnitude at the home brew level, and would make an interesting project and article.

I strongly recommend you read and/or check with a physician before beginning any exercise program. ■

THE MICRO WORKS

Give your 6800 computer the gift of sight! The Micro Works Digisector® opens up a whole new world for your computer. Your micro can now be a part of the action, taking pictures like this one to amuse your friends, watching your home while you're away, helping your household robot avoid bumping into walls, providing fast to slow scan conversion for you hams . . . the applications abound.

The Micro Works Digisector is a completely unique device; its resolution and speed are unmatched in industry and the price is unbeatable anywhere. The Digisector and a cheap TV camera are all you'll need to see eye to eye with your 6800. Since operation is straightforward, you don't have to be a software wizard to utilize the Digisector's extensive capabilities. The Micro Works Digisector board provides the following exclusive features:

- High Resolution—a 256 x 256 picture element scan
- Precision—64 levels of grey scale
- Speed—Conversion times as low as 3 microseconds per pixel
- Versatility—Accepts either interlaced (NTSC) or non-interlaced (Industrial) video input
- Compactness—Utilizes 1 I/O slot in your SWTPC 6800 or equivalent
- Economy—The Digisector is a professional tool priced for the hobbyist

The Digisector (DS-68), like all Micro Works products, comes fully assembled, tested and burned in. Only the highest quality components are used, and the boards are double sided with plated through holes, solder mask and silkscreen. All software is fully source listed and commented. The Micro Works is proud to add the DS-68 to its line of quality computer accessories for the hobbyist. Price 169.95

The Micro Works 6800 series of computer accessories also includes:

PSB-08 PROM System Board	119.95
regulated + 12 volts	124.95
B-08 2708 EPROM Programmer	99.95
regulated + 12 volts	104.95

HERE'S LOOKING AT YOU, KID

A Tour of the Faire (Part 1)

Kilobaud's editor, John Craig, takes a look at some of the people and products that made up the San Jose show.

The Second West Coast Computer Faire. What a show! I always enjoy getting out for a good convention, and this one was no exception. It occurred to me that you folks who couldn't make it would also like a peek at what the show had to offer. Therefore, I took my camera along . . . and shot pictures like crazy! I sincerely hope you find it as interesting and entertaining as I did. As a matter of fact, I'd appreciate any feedback on how you feel about the effort . . . I was a little concerned with the length.

If you're looking for software for home or small business, you'll find it here. If you're looking for the latest in mass storage, you'll find that also. Terminals? You bet. New, low-cost systems—one or two. Boards and components . . . all over the place! Finally—some of those miscellaneous pieces of hardware you've been hoping someone would develop for your system. What the heck—mention that you saw it in *Kilobaud* when you drop a line to these companies, OK?

Not all is well in "photography land," I'm afraid. I shot seven rolls of film at the Faire. You're going to be seeing the results of *six* rolls . . . and I'm going to be looking for a new film processor! There are quite a few companies, large and small, who didn't make it into this write-up because of that goof—and I'm truly sorry.

Come along with me and I'll give you a grand tour of the Second West Coast Computer Faire . . . and, above all, *enjoy yourself!* ■

OK, TRS-80 owners, here it is: the first computer cassette "magazine." CLOAD Magazine arrives by first-class mail each month on a C-30 cassette . . . for \$24 a year. Should be interesting! PO Box 1267, Goleta CA 93017.

Bob Lentz, the president of Micro Works, is as pleased with the computer portrait system his company has developed as the gentleman on the left who just had his picture taken. (PO Box 1110, Del Mar CA 92014.)

Kinda show-offish, don't you think? Although it sure did the trick when it came to attracting crowds!

I keep hearing more and more good things about the service and products from S.D. Sales . . . and they sure were doing a brisk business at the Faire. Bet they'll send you their catalog if you write for it . . . or, better yet, just check their ads in Kilobaud.

Is it Dynabyte . . . or dynamite? Let me tell you, these folks have some exciting things going! On the left we have Mike Watts, president of Dynabyte, standing in front of their Z-80 based dual minifloppy system . . . and their new double-sided, double-density Shugart floppy system. They have a rather unique dedicated-controller board (shown in the middle photo), which uses BASIC, which is why it's called a BASIC Controller. They were using the controller to run the two robots shown in the right photo, and they sure were a hit. (I think it was the robots that attracted the crowds . . . but it could have just as easily been Pam Farnsworth, the young lady minding the cables and the booth.) They have several other interesting products you might want to check into . . . drop 'em a line: 4020 Fabian Way, Palo Alto CA 94303.

What can I say? That staid, conservative gentleman on the left is the one and only Bill Godbout! (The mood of revelry was probably due to the tremendous success of his Econoram memory boards . . . and all the other items in his catalog!) The smiling face in the center belongs to none other than Carl Warren, the Senior Editor of Interface Age. The gentleman on the right? That's the real George Morrow. (Somebody who looks like George posed for the ad on page 128 of the April Kilobaud, but I know it wasn't really him because George always wears tennis shoes—and you'd never catch him with a tie on!) Godbout Electronics, Box 2355, Oakland Airport CA 94614.

Hey, there he is. The handsome and debonair Dr. Lloyd Rice, creator of famous Computalker Voice Synthesizer. If you're in the market, give this one a listen before you buy. Computalker Consultants, PO Box 1951, Dept. K, Santa Monica CA 90406.

One of the busiest booths at the Faire had to be Jade Computer Products! The man behind all the action is Don Smith (shown in the center photo with his better half, Joanne). One of the latest products to be added to their line is the REX personal computer shown in the left photo. Don's "adopted son," Heath Kline, president of Priority One Electronics (10031 Woodley Ave., Sepulveda CA 91343), was sharing the booth—and showing off his MiniScope (and many other items). You cannot believe the incredible line of computer systems, components and peripherals Jade is carrying these days. Their spring catalog will make you drool! 5351 West 144th St., Lawndale CA 90260.

Tandy was there in force . . . with many new goodies for the TRS-80. Don French (merchandising mgr. for Tandy Computers) is behind the TRS-80 on the left. His head is directly above their new electrostatic screen printer, which sells for \$599 . . . and spews out printed copy at 2200 characters per second! They also had their new minifloppies and business systems line printer up and going (right photo). Be sure to send off for their new 1978 catalog . . . it looks like they're carrying every brand on the block! 1500 One Tandy Center, Ft. Worth TX 76102.

Would you buy a reconditioned Diablo (\$1995) or QUME-based terminal (\$2495) from that gentleman standing in the background? Sure you would, because he's Ken Widelitz, attorney-at-law, author of Kilo-baud's Legal/Business Forum and president of COMPUTER TEXTile, the company offering those terminals. 10960 Wilshire Blvd., Suite 1504, Los Angeles CA 90024.

Hey, that RCA VIP (Video Interface Processor) is quite a little machine! The price is kind of high (\$275 kit), but it sure is a snap to create video patterns and games. I'd sure like to see it made a little more affordable because the 1802 has a lot going for it. RCA Solid State, Box 3200, Somerville NJ 08876.

I think I really captured the flavor of the moment here. The man on the left was a serious shopper who stopped by the Cromemco booth and hit Harry Garland (president of Cromemco) with some good questions about his system. As you can see, Harry thoroughly enjoys himself when it comes to answering such questions and pointing out the merits of his system. If you're shopping around, perhaps you should check into this "Cadillac" of S-100 systems. (Send for their new Spring Microcomputers/Peripherals catalog—\$1.) Cromemco, 2400 Charleston Rd., Mountain View CA 94043.

Dr. Curt Childress, president of Midwest Scientific Instruments, is on the left with Midwest's super 6800 system . . . and their new double-sided disk system. Curt borrowed a copy of Issue #10 of Kilo-baud and entered the Rugg/Feldman benchmarks; and he and Wayne Green are checking out the results in the photo on the right. At 1.6 MHz, the MSI 6800 came up with the following mind-blowing speeds: #1, .5 sec; #2, .5 sec; #3, 6 sec; #4, 10 sec; #5, 9 sec; #6, 12 sec; #7, 15 sec. Furthermore, the system can be run at even higher clock speeds! Their Catalog #2 is chock-full of 6800 boards, peripherals and whatever . . . send for it: 220 W. Cedar, Olathe KS 66061.

That's Mike Sherrick, the designer of the fantastic Malibu printer, and we have a review of the Malibu 160 in this month's issue. (One of their largest distributors is Jade Computer Products. Drop a line to Jade for more info.)

There seems to be an abundance of S-100 disk systems hitting the market, right? Well, in the course of shopping around, be sure to look over the capacity and software being offered with the Micropolis MetaFloppy and MacroFloppy drives. Their Extended Disk BASIC has file-management and programming capabilities, and they also have a 16K DOS. 7959 Deering Ave., Canoga Park CA 91304.

If you 6800 owners haven't checked into the line of SS-50 bus products from Smoke Signal Broadcasting then you're missing the boat! They have a DOS that supports from 1 to 3 of their minifloppies . . . patches for SWTPC BASIC . . . and a co-resident editor/assembler. They also have a 16K static memory board (\$529), and more. PO Box 2017, Hollywood CA 90028.

The Digital Group was demonstrating a graphics system that made a lot of mouths water.

There he is, folks. The man behind the CP/M Users' Group: Tony Gold. Drop him a line . . . they've got twenty-four volumes (diskettes) in the library at this time! 164 W. 83rd St., New York NY 10024.

Here's the group from ALF: Greg Bloom, Phillip Tubb (did you catch his "Incredizing" article in the April issue?) and Tim Gill. If you're into computer-generated music, these folks have some top-notch boards for the S-100 bus. Send for their catalog: 128 South Taft, Denver CO 80228.

Isn't that a beauty? The new Bytemaster from the Digital Group . . . Z-80 based with either floppies (DISKMON OS) or Phi-decks (PHIMON). They have a complete product catalog now. PO Box 6528, Denver CO 80206.

For those of you who haven't had the opportunity to meet our executive vice-president, Sherry Smythe, then allow me to introduce her. Her son, Matt, is on the far right . . . and is one of the best booth managers in the business. (Unfortunately, we're going to have to do without his fine services for a couple of years while he goes down to Central America for some missionary work.)

When it comes to quality S-100 systems, you're going to have to look far and wide before you find something comparable to the Equinox 100 . . . both electrically and mechanically. There were three factors that accounted for the tremendous crowds around the Thinker Toys/Parasitic Engineering booth: George Morrow's new floppy interface board, which can be configured for mini or standard-sized drives, the Equinox 100 and Lauren Kawakami. Thinker Toys, 1201 10th, Berkeley CA 94710—Parasitic Engineering, PO Box 6314, Albany CA 94706.

There's Chuck Grant, president of North Star Computers, with his arm resting on one of their Horizon systems. Keep your eyes open for a review of that system in an upcoming issue. With the wide-ranging use of North Star hardware and software these days, I suspect Chuck is quite pleased with what they've done. (I would have asked him, but he was too busy selling systems!) 2547 9th St., Berkeley CA 94710.

Why is this man smiling? Because he's Lou Frenzel, director of computer marketing at Heath, and he (along with everyone else at Heath) is tickled pink at the way their systems have taken off in sales. Now their floppies are here... and Heath's even happier! I can't tell you who that gentleman kneeling down (eyeing their new floppy system) is, but his initials are Steve Jobs! Drop a note to Heath and ask for their new catalog: Heath Co., Benton Harbor MI 49022.

Oh, yes... the chess tournament. What a crowd! I wasn't able to follow the action, but it was sure there. My friend, Doug Penrod (inset), played a big role in getting this event going through his "Computer Chess" newsletter (which will be a feature in Personal Computing magazine in the future).

Who says the camera never lies? In this photo, Bob Mullen (guess which one) appears as a thoughtful, contemplative, handsome and debonair designer of the only S-100 logic-probe/extender board and relay/opto-isolator control board on the market; his partner, Keith Britton, appears to be awake! (Hey, check into their new logic-probe/extender board. It uses a 7-segment display, and does the job nicely!) Mullen Computer Products, Box 6214, Hayward CA 94545.

Becky Sallume, of Vandenberg Data Products, was one of the most lively "flyer-handè-outers" at the Faire; but this photo was taken at the end of the last day! If you're in the market for a 16K S-100 board that runs cool, then send VDP some of your hard-earned money (\$330 kit; \$365 assembled). PO Box 2507, Santa Maria CA 93454.

It never fails. At almost every computer convention you have at least one person go berserk and try to hit master reset and crash a system. I guess the strain was just too much for Nancy Millikin... and I sure hope she felt better after hitting that button! On the serious side, if you'd like some additional info on Meca's fantastic mass-storage system (with a voice prompt and response capability) write to them at: PO Box 696, 7026 Old Woman's Spring Rd., Yucca Valley CA 92284. (Ask for their mass-storage buyer's guide.)

Wanna draw a crowd? Put up a Digital Research sign! I don't know whether you've noticed it or not, but there are two pieces of software playing a dominating role in this microcomputer industry; Microsoft BASIC... and Digital Research's CP/M Operating System! Heck, you can even get CP/M for the North Star drive (Lifeboat Associates, 164 W. 83rd St., New York NY 10024) and for the ICOM Frugal Floppy (Computer Mart of New Jersey, 501 Rt. 27, Iselin NJ 08830)! Digital Research has a new macroassembler and symbolic instruction debugger, both of which will be reviewed in an upcoming issue of Kilobaud. Version 1.4 of CP/M is out, too. Drop them a line for more info: PO Box 579, Pacific Grove CA 93950.

If you're in the market for a low-cost mass-storage system, then take a look at what the folks at Exatron have come up with! It's not called a cassette... it's a continuous-loop tape wafer (called the Stringy Floppy). Each wafer holds 40K bytes; and the transfer rate is an incredible 7200 kilobaud. Loads a 4K program in about 5 seconds. The system includes an S-100 controller board (with 4K monitor/assembler/editor) and the drive for \$289.50. (They also have a Tiny BASIC and a 5K BASIC available.) 1030 East Duane Ave., Suite I, Sunnyvale CA 94086.

Once again I managed to chase off the crowds for a second to grab a shot of Dan Meyer, president of Southwest Technical Products (sporting a new beard). They have a new dual-drive disk system (the DMAF1) for business applications that has a file management system called FLEX. (Oh, the drives are double-sided... 600K bytes each.) Send for their new catalog, and include \$.25, OK? Box 32040, San Antonio TX 78284.

Oliver Audio Engineering was looking good! Beautiful booth... and normally big crowds around it! By the way, did you know their new PROM programmer simply plugs into an existing PROM socket to do its thing (read, program, verify and duplicate)? Two models—and they both sell for \$295. OAE, 676 West Wilson Ave, Glendale CA 91203.

TSC started off in the 6800 software business, but they're now offering some of the same packages (their text processing, in particular) in 8080 code. They would dearly love to send you a copy of their new '78 catalog. Technical Systems Consultants, Box 2574, W. Lafayette IN 47906.

If that dapper gentleman looks like Dick Milewski of The Software Works, there's a good reason for the resemblance! If you're looking for a North Star-based inventory-control program, they have one. (A review of the package is coming up in Kilobaud.) Drop them a line for more info: PO Box 4386, Mountain View CA 94040.

Hey... the folks at the Computer Room have a couple of beautiful business systems. The one Lawrence Grijalva is demonstrating in the photo is available with a cost-estimating package (for heavy-duty construction) and inventory control. They also have a Randall Data Systems machine with a BMI (Building Materials Industries) package... everything you need for running a lumber yard. 124 H Blossom Hill Rd., San Jose CA 95123.

Well, that should do it for this time. We'll finish up our little tour of the Faire next month with Part 2: more of the people and products.—John.

Tiny BASIC Shortcuts

Tom Pittman's Tiny BASICs (6502, 1802, etc.) are somewhat limited in capabilities. This is the first of several articles discussing methods to expand those capabilities.

Charles R. Carpenter
2228 Montclair Place
Carrollton TX 75006

Writing small but useful programs in Tiny BASIC (to paraphrase Tom Pittman) is a practical reality. Getting the most out of your programs is easier if you work with the inter-

preter's limitations. The utility program in Fig. 1 shows how to work with some of these limitations. This program is titled "Loans," but it could be any comparison of WHAT-IF alternatives. Here's what we'll be working with (and without):

- Decimal numbers not allowed.
- Number range limited from -32768 to +32767.

- 72 characters maximum on Input lines.
- Implied statements and abbreviations to save bytes of memory.

(Note: Tom Pittman now has an experimenter's manual available that explains many of these features and how to work with them. They are not as simple as my approach. The manual is available from Itty

Bitty Computers, PO Box 23189, San Jose CA 95153.)

These are not significant handicaps if you're estimating the effect of several alternatives. Round numbers are usually acceptable if you only want to get on base in some specific ball park (clichés are fun once in a while).

Byte-saving Tips

Saving bytes of memory is a practical approach if your computer has limited memory (I have 1250 bytes of free space now). Let's talk about the memory-saving part first.

Fig. 1 is an example of a program with no statement shortcuts; Fig. 2 uses all the implied and abbreviated statements possible in this Tiny BASIC interpreter. Memory in Fig. 1 is 492 bytes, an average of 17 bytes per line, while Fig. 2 uses 410 bytes for an average of 14 bytes per line. REM comments were added later and used 470 bytes.

Using implied statements causes the program to run

Fig. 1. First program version using no shortcuts to write the program or save bytes. This program uses 492 bytes, exclusive of the REM statements. REM statements use 470 bytes. The short routine above illustrates how Tiny BASIC finds the number of bytes of free space remaining. The user's manual tells how to do it.

slower, but the increase in program lines is worth the loss of speed (if speed is your concern then Tiny BASIC may not be for you, anyway). Memory saving wasn't really necessary for this short program; but in a 100-line program over 200 bytes could be saved (12 to 15 lines' worth). Such significant savings allow you to write longer programs. The programs are still small, but even a few more lines make them more useful. And that's what we're trying to do. Bytes could be saved in a few more places, such as the spaces in the print input, lines 130 through 160, but in the interest of clarity, I left them alone.

Decimal Values

Calculations involving decimal numbers can be handled several ways. Anytime a percentage or a calculation resulting in a fraction occurs, a decimal number results. Dollars and cents are decimal numbers, too. Tiny BASIC truncates decimal numbers down to the next lower whole number. If the number is less than one, the result is zero. (For this

reason, accountants would probably not want to use Tiny BASIC.)

Lines 130 through 180 are the input lines for this program. I used principal in hundreds and rate in percent to avoid decimal percentage entry and to prevent dividing percent by 100 (to get back to a decimal percentage). The math comes out right when it's printed out in line 250. I then multiplied the total loan value by 100 in line 200 to make the right amount print in lines 270 and 290.

Principal input in hundreds also helps avoid the number-limitation problem. Keeping the numbers to be operated on small limits precision but keeps the multiplication results in range. Adding a statement in a print line to multiply (or divide, etc.) by some factor will put the answer back in the right magnitude. This is sort of like using engineering notation with a slide rule. The difference is the lack of decimal numbers.

An input-line limitation of 72 characters restricts the amount of data you can input. Two character spaces are used

by the prompting question mark and following space. This reduces actual data input to 70 characters, including the required commas between the data entries. With the loan amount in hundreds, I was able to input values for six loans instead of five. To overcome the limited data-input situation, write programs that will perform calculations, hold the results and return for more

data. I've done this on some data-processing routines with good results.

There's another way to accommodate more data than the line will hold. Simply input as many loan numbers (or WHAT-IFs) as needed in line 100. When the program has used the data entered, it will ask for more until the number of N entries is reached in line 320. Question marks will show up each time

1. 1.331	\$5324.00	+ \$ 4.00
2. 1.574	\$6296.00	- 104.00
3. 2.288	\$9152.00	+ 48.00

Fig. 4. For a loan of \$4000.

line 170 runs out of data and line 320 is still greater than zero.

This program only calculates simple interest loans. Compound-interest calculations require decimal numbers and raising numbers to some power. The multiplier for compounding over n periods is $(1 + I)^n$, where I is the interest expressed as a decimal and n is the number of years (or periods).

You can use this multiplier to calculate the approximate equivalent while percentage over the term of the loan. Your calculated answer will result in a much more realistic loan evaluation. I made some of these calculations, and Fig. 4 has some examples.

In the program itself, there are no unusual or unique programming techniques. There are two counting loops—one starting at line 110 and the other at line 120. Whatever

value is input for N is decremented in line 310 until the data sets, input in line 170, are used up. The counter that starts in line 120 numbers the printed output each time a pass through the program is completed.

I tried to use N to do both, but could not without using more program lines. Otherwise, this is simply a fundamental program with input between lines 100 and 170, calculations between lines 190 and 220 and output between lines 240 and 290.

Summary

It is easy to save bytes of memory if you remember to use implied statements and statement abbreviations. The user's manual for Tiny BASIC shows what is, and is not, allowed. Both the decimal number and number range limitation can be handled by using software math techniques (multipliers, dividers, engineering notation,

etc.). Line input characters limited to 70 (72 with prompting question mark and space) can also be handled by programming techniques.

Remember, if you input more than a total of 72 characters in a single line, the program will stop. Nothing more will happen

until you reset your system. If you have to reset and want to save the program already in memory, then reenter the interpreter at the soft entry point. The Tiny BASIC user's manual explains how to do this, too. A program does not have to be big to be useful. ■

North Star Software

Maillist
Maillist is a general purpose mailing label program capable of producing formatted lists for tractor-fed or Xerox type labels. Maillist will also sort lists for any field.
Price \$39.95 on diskette with manual/stock to 14 day delivery.

In-out driver
Dos in-out driver is designed to set up mapped memory video boards in conjunction with hard copy device. The user may switch output under software control. Any file directory may be listed while in BASIC without jumping to dos. Spacebar will stop output for line by line listings. Designed for use with 3P+S and any tv board.
Price \$12.95 on diskette with manual/stock to 14 day delivery.

Register
Register is a cash register and inventory control program. The software will control a point of sale terminal and printer. It will search inventory for an item, price and ticket it. Register has provisions for min-max, automatic reorder, and critical list.
Price \$299.95 on diskette with manual.

All prices are FOB Santa Barbara, California.
Terms COD Residents add 6% sales tax and \$1.00 shipping.

Try COMPUTER DIGEST... And Get A Digest of EDP & Scanning News Without Risk

By subscribing to **COMPUTER DIGEST**, you have the facts you need about computers and optical scanning.

With this information, you can act immediately on new business opportunities. Subscribe and each month you get:

- A 12-page newsletter digesting the important news in the computer and optical scanning field. There is coverage of new equipment, new optical scanning and computer forms, who is expanding, who is getting promoted—a wide variety of facts, all written in concise style, so you can read the reports in minutes.
- Over 50 news reports in each issue covering new equipment, new uses of computers and scanning equipment, new products and software.
- Not only can you find new markets, but the reports will help you solve customer

problems, because you will be more knowledgeable about computers and optical scanning.

- It's a timely summary of what is being written about computers and optical scanning in the business press. You save reading time, plus you can be sure of getting hundreds of new items of interest each year.

To subscribe, just complete the form below and mail it back. The newsletter is fully guaranteed. Read 2 issues, see if you can use the information. If you find you don't need **COMPUTER DIGEST**, just write "cancel" on the invoice we send you, and owe nothing. If you want to continue to read **COMPUTER DIGEST**, simply pay the \$40 invoice we send. We have found this is the best way to introduce businessmen to this newsletter. This way, we take all the risk, so you have nothing to lose by trying this publication.

KB/6/78

Baudot . . . er . . . Murray, Meet the H8

There is an inexpensive way of obtaining reliable and quiet hard copy for your home system; and an old five-level code teletypewriter is the answer.

Publisher's note: *The Baudot referred to in this article is actually Murray code as per my remarks on page 4. Have we all been the victim of a dastardly French revisionism plot?*

Baudot teleprinters, frequently available as surplus for next to nothing, can be used with the driver described here as a listing device for your

H8 system. Baudot printers use five information bits, rather than the seven bits used by ASCII printers, to print 52 characters. Even though ASCII teleprinters can print many more characters than Baudot machines, there are only a few programming characters lacking in the five-level printer.

By assigning arbitrary sym-

bols to cover the desirable ASCII characters not available in the Baudot set, the missing characters can be accommodated. The following assignments have been made in this driver:

- Back Space = X
- Percent (%) = (C)
- Asterisk (*) = (X)
- Plus (+) = (P)
- Less Than (<) = (L)
- Equal (=) = (E)
- Greater Than (>) = (G)
- At (@) = (A)
- Left Bracket ([) = (B)
- Reverse Slant (\) = (R)
- Right Bracket (]) = (B)
- Up Arrow (^) = (U)
- Underline (_) = (-)

You can make arbitrary assign-

ments by modifying the lookup table used in the driver program to convert ASCII characters generated in the computer to Baudot characters.

Hardware

The ASCII/Baudot driver was written for the Heath H8 computer system. This documentation assumes that the interface to the teleprinter will be made via an H8-2 parallel I/O port. Since Heath software makes no distinction between serial and parallel ports, an H8-5 serial port can be used. However, you will normally have a CRT console already connected to a serial I/O port, with the second port on the board automatically committed to the

Integrated Circuits

in the same way as for an H10.

Software

The ASCII/Baudot driver uses a lookup table to convert the ASCII character being sent to the system console to a Baudot character compatible with a five-level teleprinter. The routine is placed at the upper end of user RAM, just below the stack, where provisions have been included in Heath software to allow user memory space.

The Heath software must be reconfigured to allow the ASCII/Baudot driver to be used. The changes include: (1) redefining the high-memory limit as detailed in Table 3; (2) changing five memory locations in each Heath program, as shown in Table 4.

Once the Heath software has been reconfigured, the ASCII/Baudot routine is loaded with the Heath program. The ASCII/Baudot driver need only be loaded once when going from one Heath reconfigured pro-

cassette tape I/O. A second serial I/O board could be used, but an unusable tape I/O port would result.

A universal asynchronous receiver transmitter (UART), hex-inverter integrated circuit, Baudot clock and 60 mA loop circuitry are required to complete the interface. A schematic and parts list for this out-board circuitry are given in Fig. 1 and Table 1, respectively.

The baud-rate potentiometer, R2, should be adjusted to a frequency 16 times the teleprinter baud rate. If the teleprinter has 60 wpm gears, the clock rate should be 727 Hz; if the machine has 100 wpm gears, the baud-rate clock should be adjusted to 1187 Hz.

Table 2 shows the connections that must be made between the interface circuitry and the H8-2 parallel I/O connector. The parallel I/O cable is wired as recommended by the H8-2 parallel I/O manual for the H10 tape reader/punch. Finally, the jumpers on the parallel I/O channel should be configured

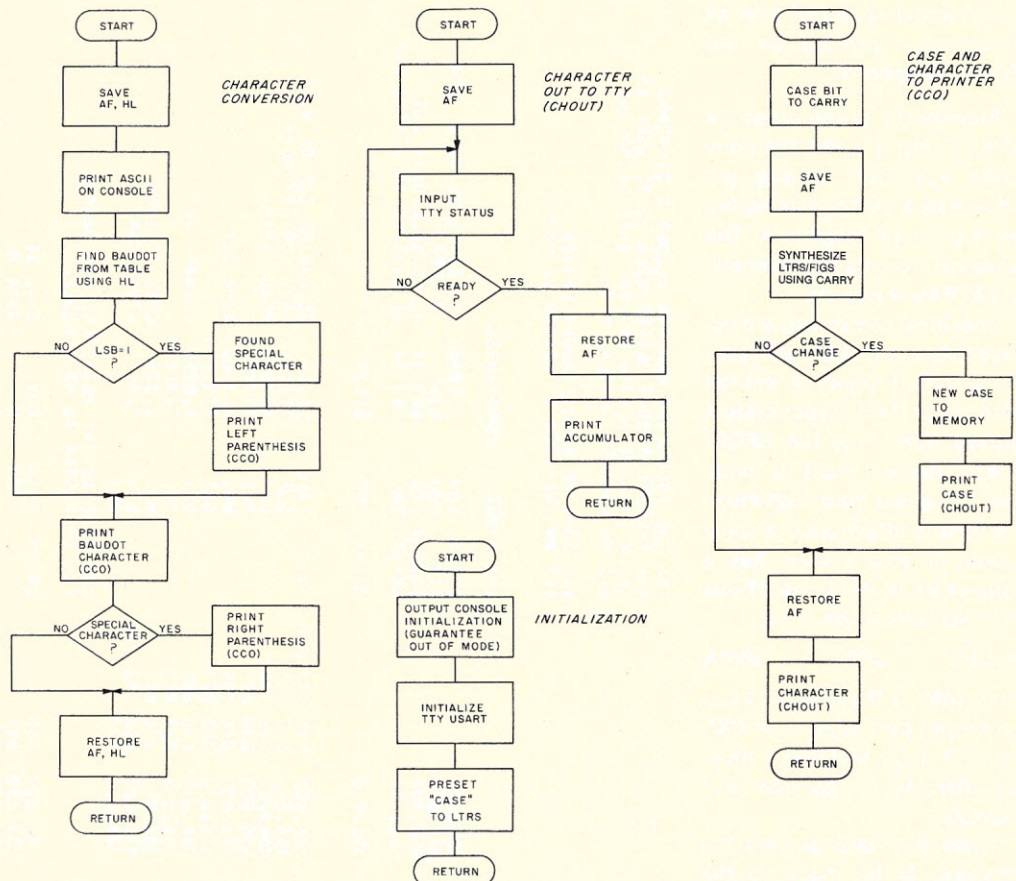

Fig. 2. Program flowcharts.

Examples:

1. Assume A is the ASCII character. Binary byte for A is 00001100. Octal equivalent of binary byte is 1400. Baudot machine prints A.
2. Assume = is the ASCII character. Binary byte for = is 10000101. Octal equivalent of binary byte is 2050. Baudot machine prints (E).
3. Assume 5 is the ASCII character. Binary byte for 5 is 01000010. Octal equivalent of binary byte is 1020. Baudot machine prints 5.

Fig. 3. Lookup table byte structure.

gram to another. For example, the following describes a typical use of the driver with the H8 editor and assembler.

1. Load ASCII/Baudot driver from cassette tape.
2. Load reconfigured H8 editor.
3. Push GO. The Baudot printer will now print each character sent to the CRT, with substitutions where required.
4. Write and/or edit source code.
5. Save source code on cassette tape.
6. Load reconfigured H8 assembler.
7. Push GO. The assembly will proceed normally, with all information printed on the Baudot teleprinter.

Flowcharts for the driver are given in Fig. 2, while the complete assembly listing (as printed by a model 28 teleprinter) is given in Program A. The program requires approximately 270 RAM locations.

The driver can be easily modified to be compatible with your H8 system. Program A will run with 16K of RAM. If your system differs from this, the BEGIN EQU statement must be modified to reflect your high-memory limit in offset octal. For example, if your system has a total of 8K of RAM, the BEGIN EQU statement would be:

```
BEGIN EQU 76000A
```

from Table 3. If you wish to use an output port other than 700, the TTY EQU statement must be changed to the new port number.

Once you have defined the changes to be made to the ASCII/Baudot driver, the source-code listing can be changed

1. Load Distribution Tape.
2. Change High Memory using Reconfigured High Memory below.
3. Change Pad from 4 to 1 (optional).
4. Record Heath program using "SAVE."
5. Proceed to instructions on Table 4.

and the program reassembled.

Lookup Table

The lookup table contains one data byte per ASCII character. Each byte contains the five-bit Baudot character to be printed plus three control bits. As shown in Fig. 3, the least significant bit in the byte is 1, if the character is one of the special Baudot characters that will be enclosed in parentheses. If the second bit in the byte is 1, the

Baudot character will be shifted to uppercase (FIGS). If the most significant bit in the byte is 1, a right parenthesis will be printed after the Baudot character. Several examples of typical characters are given in Fig. 3.

Minor keyboard variations from one printer to another may require you to alter your lookup table. Machines in common use include those having Telex, TWX, Weather, Military Standard and International Alpha-

Upper-Case	Telex	TWX	Military	International #2
B	?	5/8	?	?
C	:	WRU	:	:
D	WRU	\$	\$	WRU
F	\$	1/4	!	NA
H	#	NA	STOP	NA
J	BELL	,	'	BELL
K	(1/2	((
L)	3/4))
S	'	BELL	BELL	'
Z	"	"	"	+

Table 5. Differences in common Baudot character sets.

1. Load tape prepared using instructions from Table 3.
2. Note Stop Address.
3. Change contents of five memory locations using Table below.
4. Reenter Stop Address noted above.
5. Put new tape in record cassette machine.
6. Push "DUMP."
7. You now have a tape containing a program, the Editor, for example, which has a new High Memory point (to protect the ASCII/Baudot Driver), a new Pad, and five changes in the I/O Driver portion to provide jumps into the ASCII/Baudot Driver routines. Note that this has taken two load and dump procedures.

Memory Address	Was	Change To	Comments
040365A	1110	0270	ENTRY LO
040366A	0400	"BEGIN" HI*	ENTRY HI
041040A	3030	3150	CALL
041041A	1170	0000	INIT LO
041042A	0400	"BEGIN" HI*	INIT HI

*Use high byte of BEGIN EQU from Table 3. For example, if your H8 has 16K of RAM, you would use 1360 at memory locations 040366A and 041042A.

Table 4. Modifying Heath I/O driver.

bet #2 character sets. Stay away from Weather machines since their character set contains many inapplicable uppercase weather symbols. The differences in the remaining four character sets are summarized in Table 5.

The lookup table in this driver assumes that a Military Standard printer is used. The printer, a model 28KSR, has been modified to provide a # character for uppercase H. It is particularly easy to substitute characters in the type basket of the model 28. Other characters that may be substituted include a * for uppercase H, and a + for uppercase G. Remember that the lookup table must be modified to reflect any changes that you may wish to make.

CRT displays allow use of the back-space function (ASCII control H), while most printers do not. Since it is desirable to

tell when a back space has occurred, the character X is printed each time you back space. If, during an edit, you made a mistake and back spaced to correct it, the following would be printed:

MISTOKEXXXAKE

When listed a second time, the spelling would be correct.

All ASCII characters not covered by normal and special equivalents in the table will cause a space character to be printed. Note that lowercase alphabetic characters are not included in the table, although they can be easily added at the end of the table if necessary.

Acknowledgements

Thanks to Dr. Glyn Harding for his helpful suggestions on program structure, and to Irv Hoff for his suggestions pertaining to the lookup table. ■

TARBELL SETS STANDARDS

For Hobbyists and Systems Developers

Sales to thousands of hobbyists over the past two years have proven the Tarbell Cassette Interface to be a microcomputer industry standard. Tarbell Electronics continues research and development to produce new and efficient components to fill hobbyists' changing needs.

TARBELL CASSETTE INTERFACE

- Plugs directly into your IMSAI or ALTAIR*
- Fastest transfer rate: 187 (standard) to 540 bytes/second
- Extremely Reliable—Phase encoded (self-clocking)
- 4 Extra Status Lines, 4 Extra Control Lines
- 37-page manual included
- Device Code Selectable by DIP-switch
- Capable of Generating Kansas City tapes also
- No modification required on audio cassette recorder
- Complete kit \$120, Assembled \$175, Manual \$4
- Full 6 month warranty on kit and assembled units

TARBELL FLOPPY DISC INTERFACE

- Plugs directly into your IMSAI or ALTAIR* and handles up to 4 standard single drives in daisy-chain.
- Operates at standard 250K bits per second on normal disc format capacity of 256K bytes.
- Works with modified CP/M* Operating System and BASIC-E Compiler.
- Hardware includes 4 extra IC slots, built-in phantom bootstrap and on-board crystal clock. Uses WD 1771 LSI Chip.
- Full 6-month warranty and extensive documentation.
- PRICE:
Kit \$190 Assembled \$265

CP/M with BASIC-E
and manuals: \$100

Compatible Disc Drives

Ask about our disc drives priced as low as \$525.

TARBELL PROTOTYPE BOARD

Model 1010

- Gold plated edge pins
- Takes 33 14-pin ICs or
- Mix 40-pin, 18-pin, 16-pin and 14-pin ICs
- Location for 5 volt regulator
- Suitable for solder and wire wrap
- ALTAIR/IMSAI compatible
- Price: \$28.00

For fast, off the shelf delivery, all Tarbell Electronics products may be purchased from computer store dealers across the country. Or write Tarbell Electronics direct for complete information.

Michael Slater
P.O. Box 1123
Menlo Park CA 94025

I like objective reviews of products. Michael Slater is a development engineer with Hewlett-Packard in Santa Clara CA (i.e., he isn't associated with Intel). He makes extensive use of Intel microprocessors in his work... and has some worthwhile comments and comparisons on their new 8085. See if you agree.—John.

8080, Z-80 or 8085?

A look into the relative merits of three Intel chips—you may find that you're happy right now.

The 8085 is Intel's latest entry into the eight-bit microprocessor market. As an enhanced version of the 8080, the 8085 forms the basis of a microcomputer system that is both simpler and more powerful than the 8080. The introduction of the 8085 has made the 8080 obsolete and provided

Photomicrograph of the 8085.

some strong competition for Zilog's Z-80.

Some History

Intel's 8080 microprocessor made the first hobbyist computer possible, and has since become the standard of the industry. Though numerous other processors have taken over a significant share of the market, there is still more hardware and software available for the 8080 than any other processor. In order to make it easier for people now using the 8080 to switch to a next-generation processor, Intel and Zilog have both introduced new processors that can use, without modification, most programs written for the 8080.

Zilog's Z-80 was the first processor to threaten the 8080's market dominance by including the entire 8080 instruction set as a subset of its own, much larger, instruction set. Therefore, most programs written for the 8080 will also run on the Z-80. In addition, the Z-80's sophisticated instruction set makes it attractive for software-intensive applications. Zilog also improved the 8080 hardware by providing on-chip clock generation, single supply operation, a faster clock rate and other features.

Now Intel has introduced a new processor, the 8085, which is also software compatible with the 8080. Intel has taken a different approach than Zilog, however, by making only negligible additions to the instruction set and placing emphasis on a simplified hardware system. Intel's goal was to simplify the entire system, including ROM and RAM.

With the 8085 system, it is possible, using only three ICs, to build a system with 256 bytes of RAM, 2K bytes of EPROM or ROM, 39 bits of I/O, a programmable timer and four vectored priority interrupts. No other microprocessor can provide this much capability with only three chips.

The 8085 System

The three ICs that make this powerful system possible are the 8085 processor, the 8155

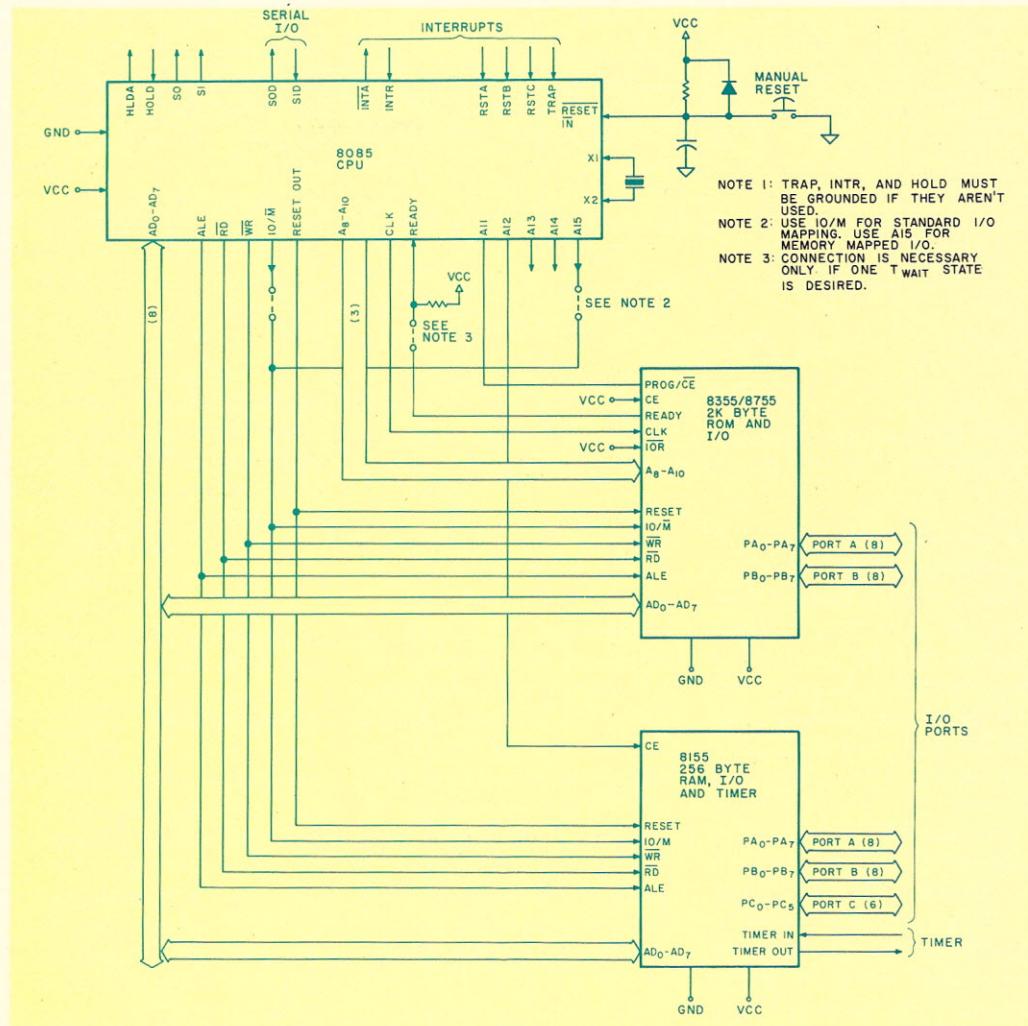

Fig. 1. 8085 minimum system. The three-chip system consists of the 8085 processor, the 8755 EPROM and I/O and the 8155 RAM, I/O and timer. The system bus is similar to the 8080 except that the low-order byte of address and the data bus are multiplexed together.

RAM, timer and I/O, and the 8755 PROM and I/O. Fig. 1 shows the complete minimal system. All three ICs are contained in 40-pin packages, which allows the integration of other functions with the ROM and RAM chips. The system has two unique features: a multiplexed address/data bus

and two special chips that provide RAM, ROM, I/O and a timer.

Fig. 2 summarizes the main differences between the 8080, the 8085 and the Z-80. The 8085 does not require a clock generator or system controller chip, as does the 8080. It provides three vectored interrupts with-

out any external hardware. Other features include a single 5 V supply, serial I/O pins and a 3 MHz clock speed.

The 8085 CPU

The major architectural change in the 8085 is the use of a multiplexed address/data bus. The data and the lower half

	8080	8085	Z-80
On-chip clock generator	no	yes	yes*
On-chip status latch	no	yes	yes
Vectored, priority interrupts without external hardware	no	yes;three	no
Nonmaskable interrupt	no	yes	yes
Single 5 V supply	no	yes	yes
Serial Input/Output on-chip	no	yes	no
Clock speed	2 MHz	3 MHz	2.5 MHz
Special multifunction support chips	no	yes	no
Multiplexed bus	no	yes	no
Expanded instruction set	—	no	yes
Dynamic memory refresh	no	no	yes

*Oscillator required

Fig. 2. Comparison of the 8080, 8085 and Z-80.

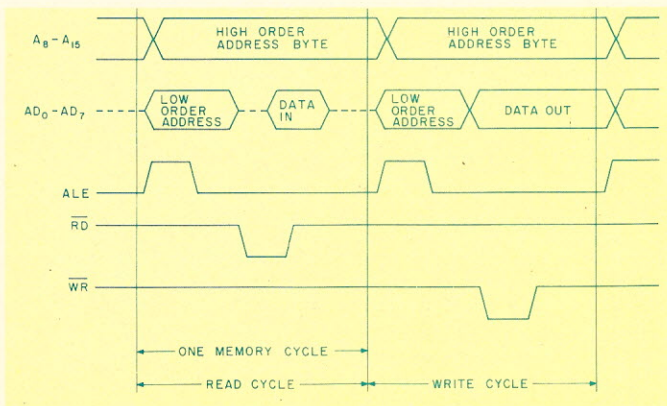

Fig. 3. 8085 system timing. The trailing edge of ALE signals the rest of the system that the address/data bus contains a new address.

of the address bus are multiplexed onto a single set of eight pins. At the beginning of each memory cycle, the low-order byte of address is placed on the address/data pins and a new control signal, Address Latch Enable (ALE), is generated to indicate that a new address is present on the address/data lines. ALE clocks this byte of address into a latch external to the processor. This latched address is then fed to the rest of the system, and the processor can free the address/data lines to carry data. The bus timing is shown in Fig. 3.

This multiplexed bus reduces by eight the number of address and data bus lines required. Only one new signal (ALE) is added to accomplish this, so the 8085 has seven more pins available for control signals. Two additional pins were freed by the elimination of the +12 V and -5 V supplies. These nine free pins make possible many of the 8085's new features.

The 8085 has four new interrupts that give it a simple and powerful interrupt structure—three priority interrupts, and one unmaskable (top priority) interrupt. Each is controlled directly by a single pin on the 8085; no other hardware is required to make the interrupts priority or mask them, or to insert an instruction on the data bus, as is required with the 8080.

The pins are called TRAP (nonmaskable) and RST 5.5, RST 6.5 and RST 7.5. Fig. 4 shows the 8085's interrupts

and their jump addresses. A high level on the RST 5.5 pin, for example, will cause a jump to address 002C, provided that interrupt has been enabled.

In order to allow these interrupts to be individually masked, two new instructions were added. Set Interrupt Mask (SIM) selectively disables the interrupts. Read Interrupt Mask (RIM) allows you to read the status of the interrupts. These two instructions are the only additions to the 8080 instruction set.

The 8085 has pins for serial I/O to provide one input bit and one output bit without any peripheral hardware. The RIM and SIM instructions are also used to read and set the serial I/O pins.

The 8085 provides all of the control signals directly at its pins. With the 8080, an 8228 is required to latch the control signals off the data bus, on which they were multiplexed.

The 8085 control bus is also organized differently. The main control signals are \overline{RD} , \overline{WR} and $\overline{IO/\overline{M}}$. $\overline{IO/\overline{M}}$ indicates whether the instruction is addressing an I/O port or memory. This saves one control line as compared to \overline{MEMRD} , \overline{MEMWR} , \overline{IORD} and \overline{IOWR} in the 8080. Both sets of signals contain the same information, and one can be generated from the other using a few gates.

The 8085 has pins for Reset In, Reset Out, Ready, HOLD, HLDA, INTR and \overline{INTA} , which function identically to those on the 8080. There are two new status lines (S1 and S0), which

indicate whether the current cycle is an op-code fetch, a read or a write, or if the processor has been halted by a HALT instruction. The read and write status information is not used to control bus transfers, but provides advanced timing information on the type of machine cycle in progress. In most systems this information is not used.

The 8085's final hardware simplification is the addition of a complete clock generator on the CPU chip. The only required clock components are a crystal or a resistor and capacitor. This incorporates the functions of the 8224 within the 8085, and completes the transition from the three-chip CPU of the 8080 to the 8085, a true one-chip CPU.

Processor Speed

As an additional performance improvement, the 8085's instruction execution rate is about 50 percent greater than the 8080's. The basic clock frequency is 3 MHz, as opposed to the 8080's 2 MHz. (The recently released 8085A-2 runs at 5 MHz!) In addition, there is a subtle increase in speed by clever handling of conditional jumps. The 8085 fetches the second byte of the instruction (the first byte of the jump address) while it is deciding if the jump condition is satisfied, and

then skips the last byte of the instruction (the second byte of the address) if it doesn't need to make the jump. The 8080 always fetches all three bytes and wastes a machine cycle if the jump condition is not satisfied. Thus, the 8085 executes an unsatisfied conditional jump in approximately 30 percent fewer clock cycles than the 8080.

There are two new versions of the 8085 now available. The 8085 is being replaced by the 8085A, which is identical in most respects. The new A version differs only in the state of certain control signals during specific conditions, which are

Interrupt	Jump Address (HEX)
RST 0	0 0 0 0
RST 1	0 0 0 8
RST 2	0 0 1 0
RST 3	0 0 1 8
RST 4	0 0 2 0
*TRAP	0 0 2 4
RST 5	0 0 2 8
*RST 5.5	0 0 2 C
RST 6	0 0 3 0
*RST 6.5	0 0 3 4
RST 7	0 0 3 8
*RST 7.5	0 0 3 C

Fig. 4. 8085 interrupts. The interrupts marked with * are new to the 8085, and each has its own interrupt request pin. The others are the same as the 8080 interrupts and are initiated using INTR and \overline{INTA} .

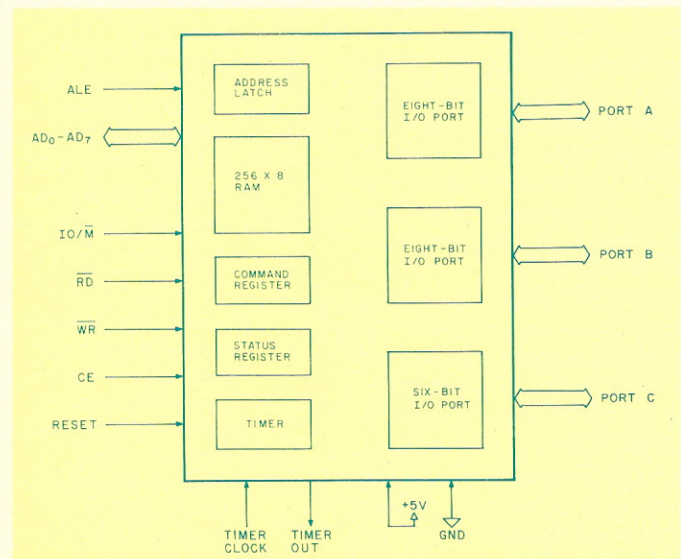

Fig. 5. 8155 RAM, timer and I/O. Each of the three ports may be selected as input or output. Additionally, port C may be selected as a control/status port. The selection of port modes, as well as the control of the timer, is performed by writing the appropriate control word to the command register.

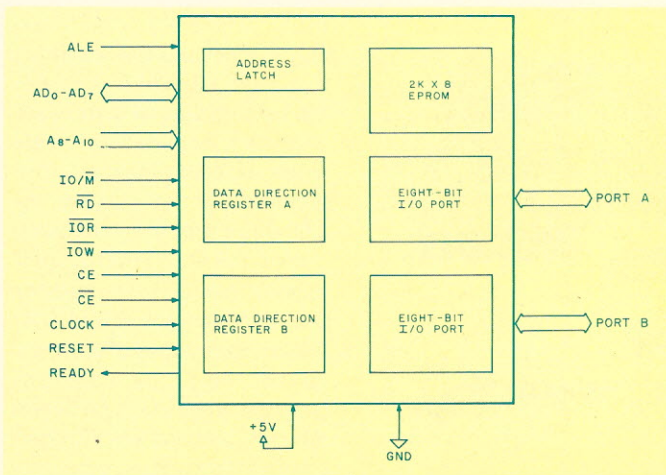

Fig. 6. 8755 EPROM and I/O. Each bit of the I/O ports may be individually selected as input or output via the two data direction registers. The 8355 is an identical part except that it contains a mask-programmed ROM.

"don't cares" for most users. The changes will make the 8085A easier to use in some large systems. The new 8085A-2 is the fastest general-purpose, eight-bit processor now available.

The 8085 Memory and Interface Chips

As shown in the previous section, the 8085 added many hardware features at the price of the added complexity of a multiplexed address/data bus. The penalty is not too high, however, since the bus can be de-multiplexed with a single eight-bit latch. And, in fact, Intel has turned the multiplexed bus into a valuable feature by providing memory and peripheral chips with the address de-multiplexing latch on the chip. Thus, the chips have only eight address/data pins and an ALE pin, instead of eight data and eight address pins. This saves seven pins on each chip, as well as seven bus lines.

The 8155 chip contains a 256-byte static RAM, two eight-bit I/O ports, a six-bit I/O port and a 14-bit programmable counter/timer. The block diagram is shown in Fig. 5. A command register in the 8155 determines the function of the ports and controls the timer. The two eight-bit I/O ports may each be specified as input or output ports. The six-bit port may operate as an input, output or control port. In the control-port

mode, it provides a strobe input for either of the eight-bit ports to be used as latched input ports. It also provides a buffer full signal for each of the ports, indicating that the port contains new data that has not yet been read.

The 8155 also contains a 14-bit programmable timer. It has several modes of operation, but, basically, it will count a specified number of clock pulses and then generate an output pulse. The clock may be the system clock or any other signal. Both the mode and the number of counts are under software control via a command register, and the timer's status may be read from a status register on the chip.

The third chip in the system is the 8755, which contains a 2K X 8 EPROM and two eight-bit I/O ports. The block diagram appears in Fig. 6. The EPROM is similar to a 2716; the two I/O ports are unique in that each line may be individually specified as input or output. Thus, you may have five input bits and eleven output bits, for example. The mode of each pin is set by software, via two data direction registers on the chip.

The 8355 is identical to the 8755, except that it contains a mask-programmed ROM. For applications where the same program is to be reproduced in considerable volume, the 8355 provides a cost-effective

alternative to the 8755.

Applying the 8085

The 8085 is a very easy micro-processor to use. Using the basic three-chip system already discussed, the only additional components required to make a complete microcomputer system are a crystal and power-up reset circuitry. Peripherals are, of course, required, but they are independent of the particular processor being used.

Standard memory and peripheral chips may also be used with the 8085, but the address/data bus must be de-multiplexed. Fig. 7 shows the address latch to perform this function, in addition to the gating to generate 8080-type control signals.

ALE strobes the address into the latch (see timing diagram in Fig. 4). The latched outputs drive the lower half of the address bus. The data bus actually contains address information early in each memory cycle. This doesn't cause any problems because neither \overline{RD} nor \overline{WR} will be true at this time, and all parts of the system should be ignoring the data bus. Once the bus has been de-multiplexed, any of the 8080 family components may be easily interfaced.

The control signal gating shown is straightforward. In practice, it will usually not be necessary to use actual gates. If the memory chips have more

than one chip enable input (many do), one can be used for $\overline{IO/M}$ and another for \overline{RD} or \overline{WR} (for RAMs) or just \overline{RD} (for ROMs). When the 8155, 8355 or 8755 are used, no gating of any kind is needed; it is incorporated into the memory chip.

An interesting side note is that the signals have been arranged on the pins of the three chips to facilitate simple and dense PC layouts. A complete system consisting of the three chips, crystal, pull-up resistor for the Ready line, and resistor, capacitor, and diode for power-up reset, fits on a circuit board measuring 3 1/4 x 4 5/8 inches. The layout for this board is provided in Intel's *8085 Microcomputer Systems User's Manual*.

Current Products

There are currently at least two 8085-based products suitable for personal-computing applications. Intel produces the SDK-85, which is a single-board computer complete with keyboard (hexadecimal and control) and a six-digit display. An 8355 ROM chip contains a monitor program to allow entering of programs, viewing the contents of memory and numerous other features. An 8155 provides 256 bytes of RAM. All of the I/O lines are available, and a large wire-wrap area is provided for expansion. A complete kit (less power supply) is available from any of Intel's dis-

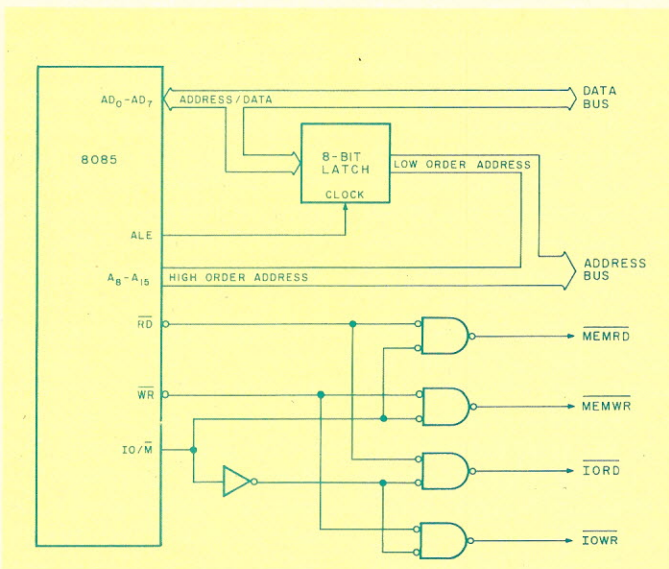

Fig. 7. Interfacing the 8085 to an 8080-type bus. The latch de-multiplexes the address/data bus, and the gates generate the usual bus control signals.

tributors for 250 dollars.

The other product is the SPACE BYTE 8085 CPU. It is an S-100-compatible CPU board utilizing the 8085 and 8155, with three 2708s, instead of the 8755. The PROMs contain a system monitor. Two RS-232C serial ports, along with parallel I/O, are provided. The bus is demultiplexed, and S-100-compatible control signals are generated. It is available from the Space Byte Corporation (and computer stores) for \$499.

The 8085 vs the Z-80

Since the Z-80 and the 8085 are the only 8080-compatible processors now available, many users will be faced with the task of selecting one of the two. One thing is clear: There is no longer any reason to design a system using an 8080.

From a software viewpoint, the Z-80 is superior. It has a greatly expanded instruction set, and double the number of registers. There is some question, however, as to the value of this increased software power.

If you program in BASIC or other high-level languages, the Z-80's extra instructions will make no difference to you. If you have an interpreter optimized for the Z-80, your BASIC might run faster than on an 8085. The difference is likely to be insignificant to most users.

One of the Z-80's features is special instructions for block move and block search. These instructions are useful when blocks of data are being processed. It must not be assumed, however, that these instructions speed up block-oriented tasks. In fact, block-move and block-search subroutines for the 8085 may run faster than the single instructions on the Z-80! The 4 MHz Z-80A is faster than the 8085 subroutines, but the difference is not likely to be significant. You would have to write and store these subroutines, however, and that is the advantage of the Z-80's built-in instructions.

In the realm of hardware, both processors have their advantages. The 8085's new interrupts are much easier to use

Intel's SDK-85 design kit.

than any of those available on the Z-80. The scheme is less flexible than the Z-80's, but is more than adequate for the vast majority of applications and requires no external hardware. For those few applications that really do require a sophisticated interrupt structure, Intel's 8259 interrupt controller chip provides this capability. Another ease-of-use factor is the 8085's on-chip oscillator. The Z-80 requires an external clock oscillator, while the 8085 requires only a crystal.

A big advantage of the 8085 is the available support chips. A much simpler and more powerful minimal system is possible with the 8155 and 8755, as compared with the Z-80 system. Because of the multiplexed address/data bus, it would not be easy to use these chips with the Z-80 (or any other processor).

The power of the 8085 system is most apparent in dedicated controller systems, where 256 bytes of RAM and 2K bytes of ROM are adequate. The 39 I/O lines provided by the three-chip system are enough for most applications. For applications requiring more memory, only one chip (an eight-bit latch such as the 8212) is required to interface to standard memories. The inclusion of the 8155, though contributing a relatively small amount of RAM, provides a counter/timer and 22 flexible I/O lines with some associated control logic.

The Z-80 also has its advantages, but they are relatively

minor. It does not multiplex any pins, which saves one chip when interfacing to standard memories. This is offset, however, by the lack of an on-chip clock oscillator.

A much-acclaimed Z-80 feature is the dynamic memory refresh incorporated into the CPU. It is not, however, without its problems. The refresh address is output during each opcode fetch cycle. Therefore, the refresh rate is directly tied to the instruction execution rate, which may have serious consequences. If the processor is single-stepped, either by slowing the clock or by using the Ready line, the refresh will no longer work. Reset will also halt the refresh, so if a manual reset push button is incorporated in the system, some form of one-shot must be used to protect the memory from being wiped out by the reset button. Finally, a lengthy DMA operation may precipitate loss of the memory contents.

A couple of other points about refresh are worth mentioning. The vast majority of systems use either static memories (where refresh is not needed) or dynamic memory cards with built-in refresh circuitry. Another consideration is that the Z-80 will usually refresh the memory at a much faster rate than necessary, resulting in a higher power consumption for the memory.

The choice of an 8085 or a Z-80 ultimately must depend upon the application. In a dedicated controller type of appli-

cation where the 8085 three-chip system provides adequate resources, the 8085 is definitely the best choice. In a software-intensive application where much assembly-language programming is anticipated, the Z-80 would probably be a better choice. For the myriad of applications that fall between these two extremes, the advantages and disadvantages of each processor must be carefully weighed. If the decision seems difficult, perhaps you can take comfort that either processor would probably do the job well.

Future Products

As may be expected, the battle between Intel and Zilog will not stop here. As Zilog is planning the Z-8 and Z-8000, Intel is working on the 8086 and 8088. The 8086 will be a high-speed (8 MHz clock) 16-bit processor to be introduced early in 1978. It has been reported that the 8088, to be released some time later, will be a 16-bit processor internally, but will use an eight-bit external data bus. Eventually, the 8088 may replace the 8085 in many applications. These next-generation processors will retain basic software compatibility with the 8085 (via assembly-language translation programs) and will also have a similar bus structure.

The 8085 may never have the popularity enjoyed by its predecessor, but its impact on the market will definitely be felt. It is especially cost effective in dedicated controller applications, but it is worth close examination by anyone designing a new system. ■

One Keyboard: Hex and ASCII

Here's a simple converter circuit that allows a single keyboard to function two ways.

Recently, when I upgraded my home-brew 1802-based system from a hex keyboard to a full ASCII keyboard, I was confronted with a problem. Once the operating system was loaded, the system could take the ASCII data and convert it to hexadecimal machine-language instructions via software. But to load the operating system I still needed a keyboard that produced hex

directly.

Inserting this simple two-chip circuit between the ASCII keyboard and the input port solved the problem. The circuit takes ASCII data from the keyboard and converts the characters 0-9, A-F to their proper four-bit hex format. Now my one ASCII keyboard can function either as an ASCII or hex keyboard, depending on system requirements. ■

THE TOTAL COMPUTER SYSTEM

RCC'S
REX
*The Total
Computer System*

☞ With RCC's REX you don't need to buy CPU boards and memory boards and parallel I/O boards and video display boards, and motherboards and serial I/O boards and disk interface boards and cabinets and chassis and keyboards and stuff!

☞ REX is the complete small computer, designed for the user who wants to buy a system with enough power to run FORTRAN . . . or Disk BASIC . . . or Z80 Assembler .

☞ The REX system costs \$2495. Sure that's more than a kit, but look what you get!

- Z80A CPU (4 MHz) ☑ standard
- 24K of RAM ☑ standard/ expandable to 64K right on the motherboard
- S-100 Bus ☑ standard/ up to 5 slots available in basic cabinet. . . expansion cabinet available soon
- Microfloppy drive ☑ one standard, one optional/ record on both sides of the diskette; 75K bytes per surface
- Bootstrap monitor ☑ standard/ in a 2708 PROM. No switches; no buttons
- Powerfail, 60 Hz timebase & vectored interrupts ☑ standard
- Black & white video interface ☑ standard/ 128 character set, 24 line, 80 char/line, full software video control
- DMA channels ☑ standard/ control lines on the bus
- Microfloppy interface ☑ standard/ includes 8 bit parallel I/O port
- ASR-33 type keyboard ☑ standard/ optional typewriter keyboard with numeric 10 key pad
- Walnut side-panel cabinet ☑ standard
- 15 Amp power supply ☑ standard

☞ Your REX system is shipped assembled, tested and burned-in. You just add a video monitor (or an RF modulator and your home TV) and select one of our optional software packages (\$195) and you are computing!

☞ Accounting programs, analysis, games . . . no problem! Your basic REX system can handle them. Of course, we offer expansion capabilities too. Options like:

- Second microfloppy drive \$450
- Programmable CRT character generator \$ 45
- 12 inch CRT monitor (green phosphor, matching REX wood-side cabinet) \$212
- 8K x 8 RAM expansion \$145
- 16K x 8 RAM expansion \$285
- Serial I/O channel (installed on initial order) \$ 35
- RF modulator (for connecting REX to home TV) . . . \$ 35
- Dot matrix printer (120 cps, 80/96 column) \$850
- Expansion cabinet for printer and two large floppy drives \$175

The software is super! Take your choice for \$195!

- ANSI FORTRAN IV, Disk Operating System, File Management System, Linking Loader, Text Editor, Utilities & Diagnostics
- Extended Disk BASIC, Disc Operating System, Text Editor & Diagnostics
- Z80 Macro Assembler, Disk Operating System, Text Editor & Diagnostics

See the REX system today at your local computer store. Or call RCC toll free at (800) 553-1863.

Is the Malibu Model 160 the Printer for Your Business System?

At \$200, this may not be a popular hobby printer, but for business, where a 132-column printer is a must, it's most interesting.

One of the most important pieces of peripheral equipment for any business system is the printer. During my search for a suitable printer for my system, I was confronted with trade-offs and considerations, but two items remained at the top of the list—dependable operation and speed. I feel that I've obtained both through the purchase of a Malibu printer and would like to share with you some of the fine points,

and a few shortcomings, of the unit.

I am neither a technician nor an engineer; I am a businessman. Even though I had some technical assistance in the preparation of this article, the bulk of the comments here reflect my feelings on how the unit contributes toward making my system the useful tool it is. John Craig suggested that I direct my remarks to other businessmen who might also be

shopping for a hard-copy device.

General Overview

As mentioned earlier, dependable operation and speed were two of the main considerations, but the added bonuses of quiet operation and styling were also realized with the Malibu unit. Photo 1 shows the styling, which, quite frankly, played a part in my decision (moving that teak cabinet into my office

was almost like adding a fine piece of furniture). The clear plastic cover over the print mechanism, which almost completely seals the entire unit, contributes greatly toward noise reduction. There is, of course, a slot for the paper to come out of the top and enter from the bottom, but the noise escaping from these two openings is minimal and not objectionable. I am sure the sound-proofing within the cabinet contributes a lot toward this end.

I've been using my disk-based Imsai system for almost a year now and there have been several instances when I've had to go through the trauma of adding (interfacing) additional devices that hardly ever worked—at first, anyway—even though the additions were installed by experienced technicians from the store where I bought my system. Adding the hardware components of this printer to my system went smoothly. The entire operation took no more than 15 minutes and simply involved removing the cover from the computer, plugging in the S-100 interface board, running a cable over to the printer, plugging it in and turning everything on! (More on the software interface later.)

Prior to the Malibu printer, I had been operating with an ASR-33 Teletype. The difference in speed, print quality and noise level between the two is so vast that I'm only mentioning the Teletype as an after-

Photo 1. The Malibu Design Group Model 160 Printer: a good-looking unit.

Photo 2. Different-sized paper and forms. A big plus for the Malibu.

thought. Comparing the dependability of the two is difficult at this time since I've only been operating the Malibu for a few weeks. Due to the small number of moving parts, I'm confident the Malibu will come out shining in this area.

Printing is done at an incredible 165 characters per second! (Memories of the Teletype surely fan my enthusiasm on this point.) Much of the speed results from the unique combination of hardware and software which allows printing in both directions and determines the shortest distance the printhead has to go to begin printing. This feature is called bidirectional printing.

For example, if a line of 120 characters has just finished printing, and the next line to be printed is 80 characters long, a line feed will be initiated and the 80-character line will be printed backwards—while the printhead returns to the leftmost (home) position. In many other printers a line feed and head return will take place before the second line is printed—resulting in a lot of wasted time.

The print quality and character set were two important considerations in my choice of the Malibu. Several of the printers I looked over during the shopping stage produced very light printouts in comparison. One of the reasons the Malibu provides such dark, high-contrast printing is due to the self-inking ribbon used. Another factor is the Hydra printhead (more on that later).

One of the features I disliked most on other printers I looked at was the absence of descenders (the "tails" of certain lowercase letters actually *descending*). The Malibu character set provides for these descenders—as all the others should. Fig. 1 is a sample printout.

I'm not particularly thrilled that the unit is a dot matrix, rather than impact printer, but my wallet is happier that I didn't go with the latter.

I've asked several of my customers what they think of the new invoices they have been getting. Generally, the response is that, though they prefer not to get invoices at all, the new ones are quite an improvement over the old (gen-

erated by the Teletype). When I press them for an opinion on the actual characters—and how they are generated (with dots)—the usual response is, "Gosh, I hadn't noticed." So much for the shortcomings of dot-matrix print.

Miscellaneous Considerations

I dislike reading equipment reports that contain numerous dry specifications. But there are several features of this printer that really should be

mentioned.

The maximum line length is 132 characters, one of the considerations that made me decide on the printer. Several low-cost printers provide 72-character width, but I find that some monthly and quarterly reports practically demand the wider paper. Invoices are prepared on 8½- x 11-inch paper, and the mailing labels I generate for customer mailings are approximately 4½ inches wide. The variable width tractors are a

Photo 3. Inside the Malibu, the three main printed-circuit boards.

```

Fig. 1. Sample printout showing normal and expanded characters. Also note the lowercase characters with descenders.

definite asset. Photo 2 illustrates this capability.

Although I intend to have my computer serviced at a local store, it seems that I could almost make the repairs myself. That is, if I weren't afraid to take the cover off the unit and dig inside, and if I had spare printed-circuit boards.

There are only three boards in the printer to control all the operations (see Photo 3). The first is the logic card that interfaces with the software. (Incidentally, all of the character generation is done in software; therefore, the character set can be easily changed.) The second board controls the motor that feeds the paper and also controls the movement of the printhead. (Software makes the decisions regarding the direction it should take for the fastest print time.) The third board drives the solenoids on the printhead.

There is a fourth interface board, which contains a Z-80 microprocessor. This board is used for connecting the printer to systems other than the S-100 type and provides for two types of interfacing—RS-232 or 8-bit parallel (at speeds from 110 to 9600 baud). My Imsai, quite naturally, uses the S-100 interface board. This board contains the programs, in programmable read-only memory (PROM), for generating the particular characters, handling the line of characters and telling the paper-feed motor when and

how far to advance.

A thumb-wheel switch in the lower left-hand corner of the printer allows the operator to select the number of spaces the paper will be advanced every time there is a FORM FEED command. This is a command from the computer which tells the printer to advance to the next form (e.g., the next invoice to be printed). The switch provides for settings from 1 line to 99 lines.

Photo 4 shows the manual paper-control switches on the cover of the unit. When the FORM FEED switch in the lower right-hand corner is depressed, the paper is advanced to the next page (the number of spaces is determined by the thumb-wheel switches).

Using this feature, the paper can be positioned to a spot called "top-of-form" so that printing will begin in the same position for each page. The LINE FEED switch will cause the paper to be advanced one space for each depression. The other two switches provide for incremental up or down positioning of the paper. No big knobs to turn—just push a button.

There is a particular feature about the ribbon which, although it is small, reflects the thoughtfulness that went into the overall design of this printer. The ribbon is set up to traverse from one side to the other *at an angle*. The result is that the printhead is continual-

ly using all of the ribbon, rather than just the top or bottom. Since ribbons are such a mess to change, I'm relieved that this

feature will surely extend the life of the ribbon.

The Hydra printhead, shown in Photo 5, is, I've been told, one

Glossary

8-bit parallel interface: Transferring data from the computer to a device one character at a time, rather than sending each bit of the character at a slower serial rate.

Bidirectional: The ability of a printer to print characters while the printhead is traveling from left to right or from right to left.

Baud: A data transmission term related to the number of bits (Binary digITS) transmitted in a second.

Character set: The complement, list or table of characters a printer is capable of printing. (With a different PROM the Malibu is capable of generating foreign-language character sets or other specialized applications.)

Descenders: The "tail" on certain letters, such as the j, y, p, g and q.

Dot matrix: The generation of characters by a matrix of dots. Following is an example of how a capital A is generated using a 5 x 7 matrix:

```
      x
     x x
    x  x
   xxxxx
  x  x
 x   x
x   x
```

Each x represents a dot made by the printhead. Due to the close spacing of the dots, the letters seem to run together into continuous lines.

Head return: The action of the printhead being returned to the home position (i.e., at the extreme left, where each new line begins). The same as a carriage return on a typewriter.

Impact printer: A printer that prints characters in the same manner as a typewriter.

Interface: The interconnecting of two devices (e.g., the computer and the printer) so they can work together as part of a system.

Line feed: The action of advancing the paper to the next line to be printed.

Line length: The number of characters that can be printed on a line (132 with the Malibu).

Patching: Modifying the software with minor changes so that the operation of a particular device becomes an integral part of the system.

Printhead: An assembly containing seven solenoids activated by electrical impulses to produce the dots that generate the printer's characters.

PROM (programmable read-only memory): A memory element that cannot be modified and can only be read. (All of the mechanical movements and character generation functions are contained in PROM in the Malibu printer.)

Routines: Program segments that are not part of the main program.

RS-232: An interfacing standard between computers and other devices that dictates the voltage levels at which data may be transmitted.

S-100: The "standard 100" pin bus that originated with the MITS Altair 8800 computer and has found widespread use in most microcomputer systems today.

Thumb-wheel switch: A rotary-type switch providing for the selection of a digit from 0 to 9.

Tractors: The devices at each end of the paper that accept the perforated holes in the paper and use those holes for feeding the paper.

Photo 4. The manual paper-control switches.

of the most reliable and rugged available. Time will be the real test of this component, which is the heart of the printer, but so far I've been impressed with the quality of print it delivers and its rugged constitution. Since the entire unit radiates quality, I have no reason to doubt the claims made about the printhead.

Software Modifications

When you add a device such as this to your system there are actually two types of interfacing to contend with—the hardware and the software.

Making the printer work with my existing software involved modifying the programs with patches so the printout would be on the Malibu, rather than my Teletype. An experienced programmer took care of these modifications in a three-to-four-hour period. He explained to me that the task could have been very difficult if I did not have well-designed software.

Basically, the modifications involved changing the programs (making patches) so when printing is desired, control is transferred to the routines in PROM (provided by Malibu) on the interface board that

handle character generation, line handling and paper-feed functions.

Closing Thoughts

The primary use for this printer in my business (restaurant supply) is for generating monthly reports, customer billing, mailing labels and some accounts payable. It handles all of these jobs without a hitch. Because it is a dot matrix printer I'm not certain that it would be as satisfactory if my requirements included large quantities of textual material. However, I intend to try it with some customer bulletins in the future. For such applications, an uppercase and lowercase impact printer may be a better choice.

I don't normally sit down to write reports on products I have bought, but I was very impressed with this printer. I'm still fascinated with the speed of the unit and appreciate the quality of the print.

I enjoy the finer things in life; I drive a 27-year-old Cadillac, and the quality built into that car will very likely keep it on the road for another 27 years. I feel the same way about the quality built into the Malibu printer. ■

Photo 5. The heart of the printer: a high-reliability Hydra printhead.

The suggested list price for the Model 160 Line Printer is \$1995 (which is very close to \$2000). For further information, contact: Malibu Design Group, Inc., 21110 G Nordoff St., Chatsworth CA 91311, (213) 998-7694.

For Your SWTP 6800 Computer ...

PERCOM'S™ Assembled and Tested FLOPPY DISK SYSTEM the LFD-400

only **\$599⁹⁵** shipping paid

The LFD-400 is ready to plug in and run the moment you receive it. Nothing else to buy! Not even extra memory!

YOU GET:

- ① The popular Shugart SA 400 minifloppy™ drive. Drive alignment is double checked by PerCom before shipment.
- ② The drive power supply—fully assembled and tested.
- ③ LFD-400 Controller/Interface—plugs into the SS-50 bus • accommodates three 2708 EPROMs • fully assembled and tested.
- ④ MINIDOS™—the remarkable LFD-400 disk operating system on a 2708 EPROM • plugs into the LFD-400 Controller card • no extra memory required • no "booting" needed.
- ⑤ Attractive metal enclosure.
- ⑥ Interconnecting cable—fully assembled and tested.
- ⑦ Two diskettes—one blank, the other containing numerous software routines including patches for SWTP 8K BASIC and the TSC Editor/Assembler.
- ⑧ 70-page instruction manual—includes operating instructions, schematics, service procedures, and the complete listing of MINIDOS™.
- ⑨ Technical Memo updates—helpful hints which supplement the manual instructions.
- ⑩ 90-day limited warranty.

Minifloppy is a trademark of Shugart Associates.
MINIDOS is a trademark of PERCOM Data Company, Inc.

The LFD-400 is readily expanded to either two or three drives. Write for details. Send for our free brochure for more information about the LFD-400 Floppy Disk System and LFD-400 software.

To save you money, the LFD-400 Floppy Disk System is available only from PerCom. Because of the special pricing, group and dealer discounts are not available.

MC and VISA welcome. COD orders require 30% deposit plus 5% handling charge. Allow three extra weeks if payment is by personal check. The LFD-400 Floppy Disk System is available immediately. Allow three weeks for testing and transportation. Texas residents add 5% sales tax.

The Great Computer Conspiracy

You've heard that some people are afraid of computers? Maybe they have good reason to be.

Clint H. Woeltjen
La Habra CA

I guess it was bound to happen sooner or later with the office computer having access to billing as well as a telephone link to the lab computer, the new gigabyte memory and the new, unproven heuristic-algorithm operating system. We should have guessed that it was up to something when the auditor's computer started finding discrepancies in our records. No mere human could possibly

have circumvented the system.

It began one day last March. The computer ordered several hundred more TTL ICs than we actually needed for the project at hand. We could find no programming error, so assumed human error or a temporary hardware malfunction and waited for it to show up again. Meanwhile, the extra ICs never made it to the lab. A mobile manipulator (we call them robots for want of a better term) had been sent to ship-

ping and receiving to pick them up, but had returned empty handed. The plant is almost entirely automated, requiring only a few engineers and supervisory personnel.

The shipping-and-receiving administrator remembered seeing the package earlier, but didn't actually see the robot pick it up. Of course, you can't question one of our robots; they have only enough memory for the task at hand, so they can't be expected to remember previous jobs. Nor did we think of

questioning the computer; after all, a computer only does what it's programmed to do (anyway, what would a computer possibly want with a bunch of ICs?). We deduced that it was employee theft, but no one would admit to having done it. We beefed up our security system (controlled by the office computer), which caused employees' morale to drop, which caused their efficiency to drop, which caused us to fall behind on several key contracts, which caused us to

become overloaded with work, which caused us to discontinue the security system.

A week later, we received a receipt for a megabyte memory that no one could remember ordering, or paying for. We checked our records and found the order, but it hadn't been initialed properly, so we couldn't tell who had ordered it. Of course, things like that aren't supposed to happen. The office computer is supposed to check for proper initials before printing the check and mailing the order. As we were overworked at the time, however, no one noticed the computer's error. This time, we ran a thorough diagnostic program, but were unable to find the bug. We didn't realize then how easy it was for a sophisticated computer to lie, its own program supplying all of the proper responses while the diagnostic rested harmlessly in memory. As happened before, the megabyte of memory disappeared.

Then the circuit-board inspector got in trouble for not asking the computer to order additional circuit-board material. He claimed that there had been two extra boxes of pre-cut boards just yesterday; so we programmed a more extensive security program, including video input of the entire lab area. This time, we didn't let the employees in on the upgraded security plan, and to make sure that no one might let it slip, I did all of the programming myself. As usual, the entire system was controlled completely by the office computer. We used the office computer rather than the lab computer because the men in the lab didn't have access to the office computer and couldn't change the program if they found out. Of course, we didn't know that the office computer and the lab computer were friends and exchanged programs whenever they felt like it.

The next day, a considerable amount of microcomputer hardware was missing, including a video terminal, several UARTs and some obsolete Z-80 microprocessors. We checked the videotapes but found nothing; the camera set up to record that part of the lab had been unplugged and the videotape erased. The night watchman claimed that he hadn't seen anyone enter or leave the building all night, but after all, he's only human and can't be in two places at once.

We were beginning to suspect that the stolen material hadn't left the building. We also noted that all that was needed to build a complete microcomputer out of the stolen material was a power supply. I instructed the lab computer to build such a supply, and left it out on the lab bench before leaving for the night. That afternoon, I also removed the cameras and deleted the security program. I had the lab administrator punch out for me, but I stayed behind in the lab. I hid within view of the bench containing the power supply and waited.

Shortly after the last employee checked out, I saw one of the robots roll across the floor, remove the power supply and head toward the lab storage area. Meanwhile, another robot had moved some boxes and was removing a metal wall plate that was normally hidden by the relocated equipment. In our earlier search we had noted the panel, but had assumed that it was an electrical maintenance panel and ignored it. I watched as the first robot arrived with the power supply, installed it and turned it on. In the recess was a microcomputer, complete with a video terminal (which indicates to me at least that the robot didn't intend to keep it a secret forever), and on the display was printed the mnemonic "DAD DE."

I didn't have the heart to turn it off. ■

FOUR STAR PERFORMERS FOR THE S-100 BUS

Meet The North Star Family

THE NORTH STAR S-100 FAMILY—four high performance products at attractive low prices. Our boards are designed for use in the North Star HORIZON computer and other S-100 bus computers using 8080 or Z80 processors. Visit your computer store for a demonstration, or write for our free color catalog.

16K RAM BOARD

No other S-100 bus memory can match the performance of the North Star 16K RAM at any price. This low-power board has been designed to work at full speed (no wait states), even at 4MHz with both Z80 and 8080 systems. Memory refresh is invisible to the processor, bank switching is provided and addressability is switch selectable in two 8K sections. Best of all, a parity check option is available. Kit: \$399. Assembled: \$459. Parity Option — kit: \$39. Assembled: \$59.

MICRO DISK SYSTEM

The North Star MDS is a complete floppy disk system with *all* hardware and software needed to add floppy disk memory and a powerful disk BASIC to S-100 bus computers. The North Star MDS is widely considered one of the best designed and most complete S-100 bus products

available. The MDS includes the S-100 interface board with on-board PROM for system startup, Shugart mini-floppy disk drive, cabling and connectors, and DOS and BASIC software on diskette. Kit: \$699. Assembled: \$799. Additional drive — Kit: \$400. Assembled: \$450. Single Drive Cabinet: \$39. Optional Power Supply: \$39.

Z80A PROCESSOR BOARD

The North Star ZPB brings the full speed, 4MHz Z80A microprocessor to the S-100 bus. Execution is more than twice the speed of an 8080, and the ZPB operates in systems both with and without front panels. The ZPB includes vectored interrupts, auto-jump startup, and space for 1K of on-board EPROM. Kit: \$199. Assembled: \$259. EPROM Option — kit: \$49. Assembled: \$69.

HARDWARE FLOATING POINT BOARD

If you do number crunching, then this board is for you. The FPB performs high-speed floating point add, subtract, multiply and divide with selectable precision up to 14 decimal digits. Arithmetic is up to 50 times faster than 8080 software, and BASIC programs can execute up to 10 times faster. A version of North Star BASIC is included. Kit: \$259. Assembled: \$359. Prices subject to change.

Personal Computer Shows

A visitor to the San Jose show suggests that organizers and exhibitors bring showmanship and general appeal to future computer shows.

Paul J. Terrell
BYTE, Inc.
1261 Birchwood Dr.
Sunnyvale CA 94086

We're growing up as an industry. That was the undertone of the recently held second annual West Coast Computer Faire. Having been an observer and participant for the past two years at computer faires, shows, swap meets, etc., I noticed that something was obviously different in San Jose. The throngs of people were there, and I judged from conversations with manufacturers that the sales level of products was just as brisk, but something was different. But what?

Electricity... it was in the walls, feeding the computer displays, but it wasn't in the air. The excitement and anticipation of new products from major manufacturers was missing. Radio Shack, Heathkit, and Commodore had long since made their debut. IBM displayed the 1510 computer, but at \$18,000, no one was beating a path to their door.

Electricity is also generated by clever new inventions, but they were in short supply at the Faire. Lots of "me too" products were on display... whatever happened to our creativity? Dynabyte put robots on display and dilithium Press released its new publication, *Robots on Our Doorstep*, but both only hinted at what's to come. That leads me to the real message in this article: the maturation of our market.

If our industry trade shows are intended for the insiders—the retailers, computer jocks

Paul J. Terrell

and technically elite—to share innovations in product design and make purchases for the next quarter- or half-year sales, then we owe it to the general public not to invite them.

If our shows are intended for the general public to increase their awareness of personal computing, then we owe it to our industry to give some thought to the educational aspects of the displays we exhibit and, in general, to the whole theme of the show.

Electricity was taken out of the air by a confused and bewildered public audience that couldn't get close enough to the displays they would have enjoyed if they had been told what they were seeing. It's a bit confusing to pass from the IBM booth with \$18,000 computers to the Jade booth with \$2 connectors and try to understand the relationship.

At the San Francisco Boat Show a person can spend \$3 for an afternoon of entertainment and education in one of Amer-

ica's favorite pastimes. Isn't that what we want of our industry?

At the Consumer Electronics Show the public isn't invited and the guests are grouped according to their buying power by brightly colored badges that distinguish the tire kickers from the chain-store buyers.

We had all the elements at the Computer Faire for a most enjoyable time—technical seminars for education, contests of computer chess for entertainment and display of new products to ponder and purchase—but something was missing. It's the same thing that is missing in most computer stores today: a guided tour... a menu... a flowchart. We need to display in the most obvious ways if we are going to bring our secrets of high technology to the public.

As our market matures from the technical activist to the consumer, so should our showmanship. Let's invite everyone to experience the personal-

computer evolution in a format understandable to all. Let's bring back "The Greatest Show on Earth" in the form of "Computer Expo."

Let's not forget the obvious help available from the product we display. *Business Week* called them "smart machines"; seems to me they should display, entertain and sell themselves. "Isn't that right, HAL?" (HAL is the computer renegade that took over the spaceship and plotted the destruction of its master in the movie *2001: A Space Odyssey*.)

While push went to shove on the exhibit floor of Computer Faire, plans for a U.S. Personal Computer Show were being presented in a dimly lit suite at the Holiday Inn. The significant point was the format of manufactures being grouped in industry segments (hobby, home entertainment, small business, education and industrial). The product presentations were more an education on computers in the home, business, industry, etc., than attributes of one machine versus the next. Contests and interaction of man and machine were most obvious in the home-entertainment area. Retailers were in storefronts and classes on computer applications were filled with the naive.

With an organized and concerted effort we could bring this "Computer Expo" of the future to Main Street, U.S.A., today. Let's get the organizers and showmen of personal computing together. In combination, their resources would give you and me "The Greatest Show on Earth" in the 1970s. ■

Initialization

Clear registers R00 thru R19
Process input and store for "seed"
Display 1001 and wait
Each press of A brings a new day . . .
Using subroutine 1', find direction
wind blows toward. Easterly is
heavily favored.

Subroutine 1' was adapted from Peter
Stark's pseudo random number
generator in "SUBMARINE"
(KILOBAUD Feb 1977 p. 70)

Store direction in R01 (⊙)
Count days (increment R19)
Find wind velocity (0 to 30) and store
Display wind direction and velocity
Authorize a launch and wait
Press B to launch the balloon
Error if launch not allowed
Round input to nearest integer and store
Check size of rounded input. Error if
less than 1 or greater than 20
Distance travelled (r) is now in R00
Convert to rect. coords. Store y in R03
Store x in R02
Compute distance from goal
Closer than 15?
If no, continue the game
Game over! Flash number of days
Game continues
Repair distance to goal
Revoke launch permit and wait
Error section
Flash .333333333
Subroutine 1'

Note: Angular mode switch must be set at "D"

Program listing.

Your balloon starts 1001 miles (use kilometers if you wish) due west from your goal. Each day you are given the wind direction and velocity and decide whether or not to launch. If you choose to launch, you decide how long to stay aloft (from 1 to 20 hours). The game ends if you land closer than 15 miles from the goal. The number of days is flashed.

You will need paper, pencil, protractor and ruler. Using any appropriate scale, locate the goal 1001 miles due east from the start. The program uses the convention for directions that is shown in Fig. 1.

1. To begin a game, load the program and enter any number (6 digits or so).

2. Press E. The display will show 1001, your distance from the goal.

3. Press A. The display shows the direction in which the wind is blowing and its velocity. The format is ddd.vv. Note: the wind blows mostly in an easterly direction. In fact, 85% of the wind direction will be between 315 and 45 (SE to NE). Of course, any game may differ from these expectations.

4. Make launch decision. If no, go to step #3 for next day's wind. If yes, enter a whole number from 1 to 20 and press B. Your balloon will travel that many hours. The display shows how far from the goal you landed. Plot your trip carefully. Go to step #3.

5. If you land closer than 15 miles from the goal, the display flashes the number of days. Press CE to stop the flashing. Go to step #2 for a new game. Flashing .333333333 indicates an error (like if you specify a 22 hour flight). Press CE and try again. ■

(In terms of rectangular coordinates, you start at 0,0; the goal is at 1001, 0.)

Fig. 1. Conventional compass directions are used to form game board.

Here's how the Computer Workshop works for you.

Our clients get the whole thing—total systems engineering. We can help you with evaluation and development of requirements for data processing and associated hardware, or give you management assistance in developing systems. We'll develop and design computer systems, and we'll design, organize and manage special training programs for your staff.

So even if your needs are minimal right now, we can be a big help. Then as your needs grow, you'll know where to come.

The Computer Workshop

Here are some of the firms we represent:

Alpha Microsystems	North Star Computers

"INDUSTRIAL" WIRE WRAPPING TOOL

Model BW 520 is a battery operated wire-wrapping tool, also available in reversible models for wrapping and unwrapping operations. The rechargeable nickel cadmium battery is self contained in the handle of the tool. Also available with "Backforce" device to prevent overwrapping.

Uses any 24AWG thru 32AWG wrapping bits and sleeves.

OK MACHINE & TOOL CORPORATION
3455 Conner St., Bronx, N.Y. 10475 / (212) 994-6600 / Telex 125091

Transfer Vectors vs Absolute Addressing

You can save memory by reusing program modules and algorithms.

William Nichparenko
Sunick Systems
185 Summit Dr.
Santa Cruz CA 95060

Those of you involved in heavy assembly language programming will find Bill's article very worthwhile. He's

discussing the technique of using transfer vectors which, incidentally, was the subject of an article by Art Childs in Issue #1 of Kilobaud. Art discussed the use of the

transfer vector with regard to accessing I/O routines ... Bill's approach deals with using the transfer vector as opposed to absolute addressing. — John.

If you are not fortunate enough to have a sophisticated operating system, but would like to have some modular software that you can use with ease, the follow-

Fig. 1. Assembly language representation of the module and the object code generated.

ing method may be of interest to you.

The Problem

Suppose you have a software module called Printer Control (known as the base module from here on). Fig. 1 is arranged so that the assembly language representation of the module and the object code (or machine language) that it generates are adjacent for easy comparison. This module has a reference entry point of 700 hexadecimal, used whenever entering the module by itself. The purpose of the module is to take a byte of information in the A accumulator, operate on it, and return to the main program when completed. This base module contains various subroutines within it

(for illustration purposes call these subroutines A,B,C) that are useful to other modules. For example, a TAB module, entirely separate from the Printer Control module, may want to use subroutine A of the base module to perform a carriage movement without printing any letters. The problem that arises is that other modules, not having been assembled at the same time as the base module, must call the subroutines A, B, and C by absolute addresses (i.e., a machine code value in hex or octal as opposed to a symbolic address). This is fine as long as none of the addresses in our base module change. Unfortunately, any time you want to modify the base module, many of the sub-

routine call addresses in all the other modules using the base module subroutines may have to be changed. This is a time consuming and error prone process.

The Solution

A simple solution is to place a transfer vector (a collection of jump commands pointing to the locations of assembly language subroutine labels A, B, C) in front of the module's object code. The absolute address of the transfer vector never changes, but the addresses within the module that correspond to subroutines A, B, and C are changed every time the module is altered and re-assembled.

If new subroutines are added to the module, a new

bytes of memory are needed for each new jump instruction). Note also how the absolute addresses of each subroutine have changed, and how the corresponding jump command operands in the transfer vector have changed accordingly. A subroutine call to location 6FA will enable the use of subroutine B in either the old or the new edition of the base module.

Fig. 3 shows how the base module can be used in any one of the three possible modes. The first mode is a direct call to the base module at location 700 hexadecimal. This uses the full capability of the base module to call each of the three subroutines A,B,C as needed. An important point to note is that each of the subroutines within the

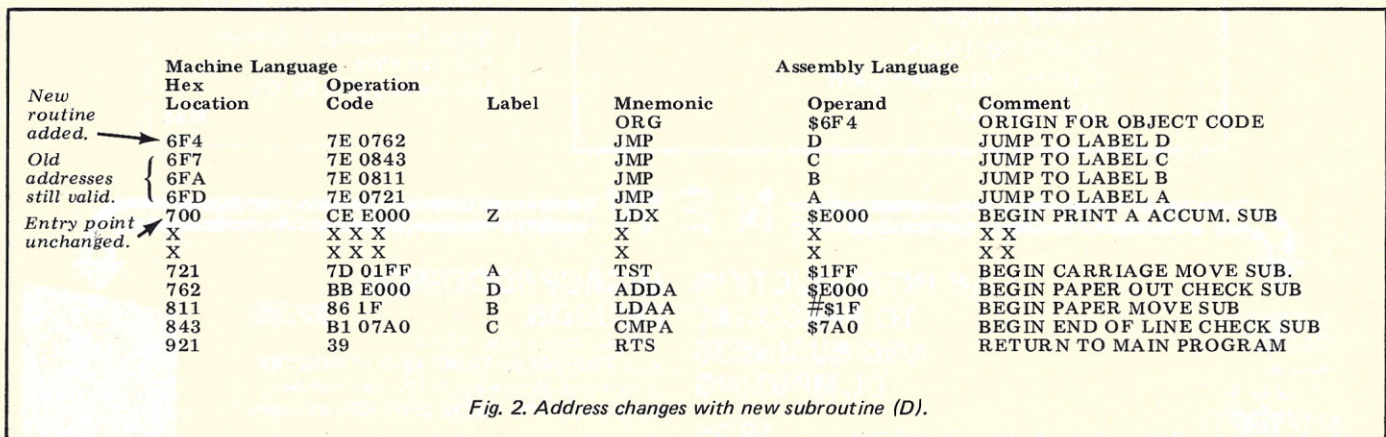

Fig. 2. Address changes with new subroutine (D).

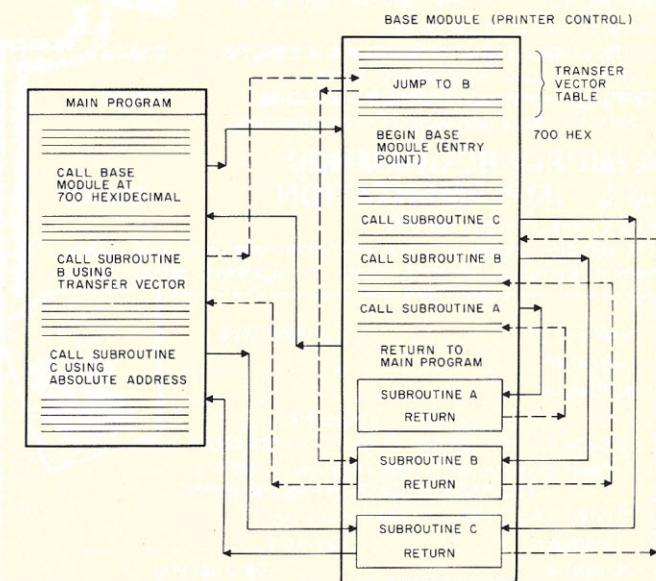

Fig. 3. Various uses of base module.

jump instruction is appended to the transfer vector so as to not change the absolute addresses of the jump instructions contained in its earlier versions. The only thing that need be remembered is to arrange the assembler origin such that the reference entry point to the module does not change.

Fig. 2 shows how various addresses might change with addition of a new subroutine, labeled D, to the module. Note that a new assembler origin of 6F4 is necessary to maintain the absolute addresses of the old transfer vector and the reference entry point of the base module (three additional

base module must have its own return command in order to be useful outside the base module. Upon completion, the base module returns control to the main program.

The next call from the main program illustrates the use of the transfer vector to call subroutine B in the base module. Finally a direct call to subroutine C at its absolute address illustrates what we are trying to avoid by the use of a transfer vector. If the address of C changes due to a modification in the base module, so must the absolute call in every main program that uses subroutine C directly. ■

- *User Manual

HIGH RESOLUTION GRAPHICS

In response to your requests, we now offer the K-1008, a Dot Matrix display board (320H x 200V) for the KIM-1.

But — we didn't stop there. We also call it an 8K memory board, directly connected to your KIM-1. Full read/write with no wait states or snow ever.

And — we made it low power to reduce system costs. In fact our 18 watt K-1000 power supply can typically power your KIM-1 plus 32K of K-1008 memory.

How to use it — The K-1008 visible memory only needs a power supply and a KIM-1 to function as memory. Add a standard monitor and you have high resolution graphics for diagrams, graphs, even variable font text up to 22 lines of 53 characters.

K-1008 Assembled/Tested

**LET US SELL
 YOUR NAME & ADDRESS**

If you are a dealer or a manufacturer (or almost anything else in the hobby computer industry) you might as well send Kilobaud your name and address so we can sell it to people who want to sell you things. Manufacturers are looking for dealers . . . they use our list. Dealers are looking for new products . . . and they use our list. We may not make any money publishing Kilobaud, but we're making out like crazy with our list. Don't miss the fun . . . get on our list. Write Kilobaud List, Peterborough NH 03458 and get rich. We don't do badly either at \$100 a shot for the list, currently over 2500 strong.

**THINKING OF
 MANUFACTURING?**

If you are about to foist a fantastic product on the multitudes of gullible computerists out there you will want to see if you can get on our mailing list for the Kilobaud Knewsletter for Klubs, Dealers and the Microcomputer Industry. This continuing bunch of gratuitous advice from Wayne Green will tell you how to run your business, make a club grow, and a lot of other things you'd rather not know . . . or probably know better than Wayne anyway. The Knewsletter has one sterling benefit . . . it's free, and worth maybe half that. Write Kilobaud Avuncular Advice Knewsletter, Peterborough NH 03458 . . . and wait.

Error Correcting Codes

Error correcting codes are a software technique for detecting and correcting hardware errors that sometimes occur in data-transmission systems.

Most of us are familiar with detecting errors using a parity bit. The ASCII 7-bit code is usually accompanied by an 8th bit which is set either as 0 or 1 depending on whether the first 7 bits have an even or odd number of bits turned on (or set to 1). The kind of parity is either even or odd depending on whether or not the entire 8 bits have an even or odd number of bits on. Since the 8th bit is set on or off as a result of the first 7 bits, every set of 8 bits can be sent with the identical parity. At the receiving end, all we need to do is check each 8-bit string for its parity; when one comes along with the wrong parity, we have detected an error. Unfortunately, we have no idea which bit has been clobbered in the channel, and therefore we must request that the string be retransmitted.

Checksums perform the same sort of basic function (detecting errors), but they

too suffer from the inability to indicate where the error(s) occurred. Also, since checksums occur after several strings of bits have been sent, a checksum error means that the whole message must be resent. If the channel is

bit 1	bit 2	result
0	0	0
1	0	1
0	1	1
1	1	0

Table 1. Truth table for the Exclusive OR operation.

One way to interpret this operation is to view the result as a parity bit which results in even parity. Thus, if we have a string of bits such as 001011 and perform the Exclusive OR $0 \oplus 0 \oplus 1 \oplus 0 \oplus 1 \oplus 1$ the result would be 1. Being able to do Exclusive ORing on a string of bits is necessary when more bits are involved in each message string (more than just one like in this first example). Another way to get the result of a string of EX ORs is to find out how many 1s there are, and if the number is even, the result is 0; if the number is odd, the result is 1.

subject to much noise, we can expect at least a few errors in a long message, and we may end up sending and resending the message several times before an error-free message is received.

With a few extra parity bits interspersed throughout the string of bits, we can not only detect errors but also locate the bit in error, invert it, and have a correct message received without having to send the message more than once. This sort of parity checking (with extra parity bits) is known as error correcting, a bit more sophisticated and helpful than simply error detecting.

Error Correction — Needs More Parity Bits

In order to have a coding scheme that not only detects errors, but corrects them, it seems only natural to have to pay a price. The price is in terms of extra parity bits. For short strings of bits, the

parity bits occur almost as frequently as the message bits. In fact, to send a single bit and detect and correct errors, two parity bits are required. An example will help clarify this point, but in words we must be aware of the fact that errors can occur in the parity bit(s) as well as

Position	Binary Address
0	000
1	001 P
2	010 P
3	011 M
4	100 P
5	101 M
6	110 M
7	111 M

Table 2. The parity bits are at positions in which only a single bit is on. Look down a column. Wherever there are 1s in the column, note the positions. There will only be one parity bit in each column and three message bits. (In general, $(2^{n-1}-n)$ message bits will be used to encode each of the n parity bits.)

in the message bit(s). If such an error does occur, we want to be sure that we don't assume that the message bit was in error and invert it by mistake.

One Message Bit

Suppose we have only one bit to send, which we shall label as M. The error correcting code will have three bits in total: M and two parity bits, P₁ and P₂. The string will look like MPP, or better, M₃P₂P₁ with the subscripts indicating which bit is sent first. M₃ means that the message bit will be the third bit in the string. Now we must know how to encode the parity bits P₁ and P₂.

The error correcting code discussed here depends heavily on the use of the Exclusive-OR logical function (see Table 1). The notation ⊕ will be used to indicate Exclusive-OR.

Let's set P₁=M₃ and P₂=M₃ and see what happens. If the message is M=1, the string will be 111. Now at the receiving end, the string is analyzed by determining the results of the Exclusive OR checks shown in Example 1.

Believe it or not, this check indicates that there is no error in the string. Reading from the top down, the two 0s indicate that error occurred in the 0th bit (which does not exist).

One Message Bit — One Error

If an error in transmission had occurred, one of the bits in the message would have been a 0 instead of a 1. If the first bit were the source of error, the received message would have been 110 and the check would have given Example 2. This indicates that the error occurred at location 01 binary, or the first bit (which we knew because we made the error in bit 1). If the error occurred in bit 2, the received message would have been 101 and the check would be Example 3. This indicates an error in bit 10 or bit 2 (10 is binary for 2). Of course, had the error

$A_1 = P_1 \oplus M_3 = 0$ $A_2 = P_2 \oplus M_3 = 0$ <p><i>Example 1.</i></p>
$A_1 = P_1 \oplus M_3 = 0 \oplus 1 = 1$ $A_2 = P_2 \oplus M_3 = 1 \oplus 1 = 0$ <p><i>Example 3.</i></p>

$A_1 = P_1 \oplus M_3 = 1 \oplus 1 = 0$ $A_2 = P_2 \oplus M_3 = 0 \oplus 1 = 1$ <p><i>Example 2.</i></p>
$P_1 = M_3 \oplus M_5 \oplus M_7$ $P_2 = M_3 \oplus M_6 \oplus M_7$ $P_4 = M_5 \oplus M_6 \oplus M_7$ <p><i>Example 4.</i></p>

been in the third bit, or message bit, the check would reveal 11 which is binary for 3.

Several Message Bits

There are some fixed number of message and parity bit combinations which are not possible in this single error correction coding scheme. In general, it is the number of parity bits which fixes the number of message bits included in each distinct string of bits. The number of bits in a string is 2ⁿ-1 where n is the number of parity bits. For the two parity bit example, 2²-1 = 3, the total number of bits in the string. The number of message bits in the string is, therefore, (2ⁿ-1) - n. What does this mean if we try 3 parity bits instead of 2? Plugging in we get 2³-1-3 = 4 message bits. Thus, the string will be 7 bits long, and there will be 4 message bits and 3 parity bits. Let's jump to 5 parity bits. In this case, there will be 31 bits in the message, and 26 message bits. The ratio of information (message bits) to

checking (parity bits) improves as the strings get longer. But as we will see, the amount of processing needed during encoding and decoding also increases as the length of the string increases.

In this example using 7 bits (4 message and 3 parity), we will assume that you understand the Exclusive OR operation and binary notation. The first problem is to locate where the parity bits belong. Mathematically, they are put in locations 2⁰, 2¹ and 2² which is easily generalized, meaning that for n parity bits, the ith one belongs in position 2ⁱ-1. For our three parity bits, this means they are the first, second, and fourth bits in the string. The message bits are put in the unused positions, which are 3, 5, 6 and 7.

To determine the coding for the parity bits we'll give you a scheme later. For now, just the notation will do. First, our string will look like this:

$$M_7 M_6 M_5 P_4 M_3 P_2 P_1$$

and is sent out by shifting it

to the right one bit at a time (e.g., serial transmission across the phone lines or into a cassette recorder). The parity bits are determined using the message bits in Example 4.

This may appear at first to be sort of random, but look closely. The parity bits occur at positions such that any combination of 0s and 1s for them will encode a binary address from 0 to 7 by adding up the position numbers (which we will find out is the address of the bit which is in error). Also, the positions of the message bits are such that only those in which bit 1 is on (for positions 3, 5, and 7 in binary) are used to encode parity bit P₁. P₂ is encoded using the message bits in locations in which the second bit of a three bit binary address is coded as 1, which are positions (addresses) 3, 6 and 7. Likewise, P₄ uses the bits located in positions in which the third bit of a three bit binary address is 1. A look at the list of numbers in Table 2 will help.

The position 0 (000 binary) is not used during the encoding. For the rest of the table, the columns are the key thing to look at. The parity bit being encoded will be associated with three message bits, found by the positions in which a 1 is found in the column along with the 1 associated with the parity bit. The first parity bit is in position 1, and in that column, positions 3, 5, and 7 also have a 1.

The next step is to take a message (any 4-bit message will do) and encode it into a 7-bit string. I chose the message 0111 which is hex 7. (The important thing to keep consistent is which way to read the message. The bits are to be shifted right if they are serialized.) In this 4-bit message, the individual message bits are: M₃ = 1, M₅ = 1, M₆ = 1, M₇ = 0. The parity bits are shown in Example 5. The entire string of bits will be (starting with bit 7 on the left) 0110100.

$P_1 = 1 \oplus 1 \oplus 0 = 0 (= M_3 \oplus M_5 \oplus M_7)$ $P_2 = 1 \oplus 1 \oplus 0 = 0 (= M_3 \oplus M_6 \oplus M_7)$ $P_4 = 1 \oplus 1 \oplus 0 = 0 (= M_5 \oplus M_6 \oplus M_7)$ <p><i>Example 5.</i></p>
$A_1 = P_1 \oplus M_3 \oplus M_5 \oplus M_7 = 0 \oplus 1 \oplus 1 \oplus 0 = 0$ $A_2 = P_2 \oplus M_3 \oplus M_6 \oplus M_7 = 0 \oplus 1 \oplus 1 \oplus 0 = 0$ $A_4 = P_4 \oplus M_5 \oplus M_6 \oplus M_7 = 0 \oplus 1 \oplus 1 \oplus 0 = 0$ <p><i>Example 6.</i></p>

Now let's send this message with no errors. At the receiving end, the string is processed by performing Example 6. The address of the error is 000, or position 0, which is not in the string. If none of the bits have changed during transmission (no errors) then it makes sense that each of the Exclusive ORs should result in 0s. Remember, P_1 was the result of $(M_3 \oplus M_5 \oplus M_7)$ and therefore, doing the checking is like doing the following: $(M_3 \oplus M_5 \oplus M_7) \oplus (\bar{M}_3 \oplus \bar{M}_5 \oplus \bar{M}_7)$ where the M means the received message bits. We can reorient this expression as $(M_3 \oplus \bar{M}_3) \oplus (M_5 \oplus \bar{M}_5) \oplus (M_7 \oplus \bar{M}_7)$ which compares each message bit before and after transmission. If no change has resulted, the \oplus will be 0 for each pair (a bit \oplus d with itself is 0), but if a single bit has inverted due to error, the result will be a 1. Studying this a bit longer (no pun intended) will show you how the scheme will give you the

$A_1 = P_1 \oplus M_3 \oplus M_5 \oplus M_7 = 0 \oplus 1 \oplus 0 \oplus 0 = 1$ $A_2 = P_2 \oplus M_3 \oplus M_6 \oplus M_7 = 0 \oplus 1 \oplus 1 \oplus 0 = 0$ $A_4 = P_4 \oplus M_5 \oplus M_6 \oplus M_7 = 0 \oplus 0 \oplus 1 \oplus 0 = 1$ <p style="text-align: center;"><i>Example 7.</i></p>
$P_1 = M_3 \oplus M_5 \oplus M_7 \oplus M_{11} \oplus M_{13} \oplus M_{15} \oplus M_{19} \dots \oplus M_{31}$ <p style="text-align: center;"><i>Example 8.</i></p>
$A_1 = 01010101 \quad \bar{A}_1 = 10101010$ $A_2 = 01100110 \quad \bar{A}_2 = 10011001$ $A_4 = 01111000 \quad \bar{A}_4 = 10000111$ <p>(The bar means not or complement, or in this case, when $A_n = 0$.)</p> <p style="text-align: center;"><i>Example 9.</i></p>

actual position of the error.
A 7-Bit String with One Error
 Using the same message bits as before, let's find out what we'd do if we received the following message: (don't look back at the original string just yet) string =

0100100. We know this is a 3 parity bit code, and the parity bits are in locations 1, 2 and 4, thus $P_1 = 0$, $P_2 = 0$, and $P_4 = 0$. Also, the message bits are $M_3 = 1$, $M_5 = 0$, $M_6 = 1$, and $M_7 = 0$. Now let's decode the address of the error, if any, in Example 7.

The address of the error is position 5, read from A_4 and A_1 , both being on; their sum is 5. Now correct the string to read 0110100 (invert position 5's bit from a 0 to a 1) which is the proper string. The message bit was in error in this case, but in others, the parity bit may have been the one in error. Rather than correcting the string, it might be quicker and more efficient simply to check the address to determine whether parity or message bits were involved and ignore the correction if a parity bit was in error (who cares about parity bits after the message has been sent?).

Try doing the error checking for other position errors. Also, where there are two errors, this system will not locate the address of the error, but it will indicate that an error was received (one or more of the error address bits will be on). This error correcting code will handle most errors as long as the error rate is fairly small (so that two errors are not likely to occur in the same string).

What to do with Error Correcting Codes

The 7-bit string used in the example only allows 4 message bits to be sent with each 3 parity bits. This sounds inefficient, and in terms of getting a lot of data through a channel it is. However, it helps eliminate an occasional missing bit, which may be even more disastrous than a slower effective bit rate. With 5 parity bits, the relative number of parity bits is substantially reduced compared to the number of useful data bits. The 31 bits in a string result in 26 message bits, which is enough to encode 3 8-bit bytes with 2 extra bits which are of little use. The problem with the 31 bit message is the number of Exclusive ORs needed. For example, the first parity bit is found using the calculation in Example 8.

Another problem for the programmer is how to do bit-specific Exclusive ORing efficiently. Hopefully, an article will appear describing a program to implement the 7-bit string error correcting coding in the near future. As a start on the programming, put masks in memory as shown in Example 9.

If it is determined that the location of the error is $A_1=1$, $A_2=0$, $A_4=1$, then use the AND function to AND A_1 , \bar{A}_2 , A_4 which will result in the following mask in the Accumulator: 0001000. Simply \oplus this with the received string, and the proper bit will be inverted, which is bit 5. Note also that by ANDing A_1 with the string, only bits 1, 3, 5 and 7 can get into the Accumulator, at which time you need only to determine the parity (number of 1 bits) and if it is even, the result will be 0 indicating that as far as the A_1 portion of the position, use \bar{A}_1 mask. Whether to use A_2 or \bar{A}_2 mask, AND A_2 with the string, determine the parity, and select A_2 or \bar{A}_2 depending on whether the results are odd or even respectively. ■

The New Star In Disk Systems

4 TIMES THE STORAGE. TWICE THE SPEED.

IBM COMPATABILITY

Introducing Thinker Toys™ new DISCUS I™ standard floppy disk system for just \$895.*

It's the new standard of performance in S-100 disk systems. Because DISCUS I's standard floppy format holds 4 times the data per disk as North Star's mini-floppy costing \$777.

And DISCUS™ is twice as fast as the North Star. And has twice as many tracks. And twice as much data on each track.

That's four times the performance for just \$118 more.

But that's not all. DISCUS I™ is both S-100 and IBM-compatible. Plus, our plug-in S-100 controller has an on-board serial I/O port, cache buffer, and read/write/seek routines in on-board ROM. There's even a bootstrap loader.

DISCUS I™ comes as a completely assembled system. A Disk Jockey I™ controller and cable set interface your S-100 mainframe to the handsome free-standing Shugart disk drive unit—which comes complete with cabinet, power supply and fused detachable line cord.

The price also includes DOS, ATE™ assembler/

editor, patches for CPM, and Advanced BASIC (available mid-1978) software.

We also offer CPM (\$70) and Micro-soft Extended Disc BASIC (\$199).

DISCUS I™ has Shugart reliability, Morrow's Micro-Stuff performance and Thinker Toy™ sales and service nationwide. It's fully assembled, tested and warranted (drive 45 days, controller 1 year).

Don't invest in a floppy that can't deliver big performance right now. Buy DISCUS™ standard floppy system today . . . while our special \$895 introductory price (\$100 savings)* is still available.

Ask your local computer store to order DISCUS I™ before July 1st. Or send your check or money order to THINKER TOYS™, 1201 10th Street, Berkeley, CA 94710. Or call (415) 527-7548, 10-4 pm PST. Add \$3.00 handling; California residents add tax.

Thinker Toys™

1201 10th Street
Berkeley, CA 94710

* Introductory prices until June 30, 1978 only.

Publisher's note: *The Baudot referred to in this article is actually Murray code as per my remarks on page 4. Have we all been the victim of a dastardly French revisionism plot?*

ASCII to Baudot . . . er . . . Murray (the Hard Way)

Mini Micro Mart strikes again—as you will see in this consumer report.

And so it goes—the continuing saga of the computer hobbyist community and its special relationship with Mini Micro Mart. Naturally, you won't be able to get into this relationship until you order something from Mini Micro Mart; and then you'll find out (as John, Ray and so many others have) why it is a special relationship. Without hesitation, I can recommend at least one product for you to buy from MMM: the GPA-B ASCII/Baudot converter board. The reason for this is because you can become familiar with possible problems you'll encounter by reading the following article. —John.

The Mini Micro Mart GPA-B is a kit that converts parallel ASCII to serial Baudot. This is obviously a very useful device for hams and computer hobbyists who have Baudot teleprinters, such as the models 15, 19 and 28. These are frequently available and quite inexpensive; many hams have them already. Conversion from ASCII to Baudot can be done in either hardware or software; a hardware conversion system can save a couple-hundred bytes to be used for other pur-

poses in your computer. Whether this particular hardware conversion is worthwhile will be left up to the reader to judge—read on!

For those who have not dealt with Mini Micro Mart, they are located at 1618 James Street, Syracuse NY 13203. They offer quite a range of computer equipment, both surplus and kits, at very low prices. Cynics might observe here that you usually get what you pay for; this is not far from the truth.

One of Mini Micro Mart's

most recent bulletins points out that they cater to the "true hobbyist." This particular species is a subset of the hardware type with whom we are all familiar; he is the sort of person who feels that Heathkit-style instructions are demeaning and that (one gathers) finding errors in design and manufacture is an interesting challenge. This is a rather recent definition of Mini Micro Mart's customers; it did not exist (at least in print) when I bought the kit. But since they specify who their ideal customers are, let us now explain who we are so that readers can judge how well we fit the mold.

"I" in the rest of the article refers to John, K8UP (as in microprocessor). I am a ham (since 1964) with the usual experience with a combination of home-brew, kit and commercial ham gear. Digital electronics is fairly new to me, although I have been programming computers for a couple of years now. As a computer hobbyist, I am definitely a "software type."

Ray is a hardware type—an electronics technician by profession, as well as by avocation. His background, like mine, is mostly in communications electronics. We are both members of the Ann Arbor Computer Club, which is the source of this collaboration.

More on MMM

Mini Micro Mart does not ser-

vice what it sells. Until a few months ago, their customers were forced to live a catch-as-catch-can existence scurrying to locate suitable shops to service their equipment; now MMM recommends an independent repair service. Their reasoning is that some people do not know how to put kits together, and so the company cannot take responsibility for resulting errors. My own opinion (for what it is worth) is that if MMM took responsibility for making the kits work, they would not be able to send out erroneous documentation, defective parts or incomplete kits the way they do now.

What I received in this instance is pictured in Photo 1; documentation consists of a parts list, a schematic and a layout diagram. The schematic and the layout (at least for this kit) were not in agreement. Part of the reason for this seems to be that MMM makes several ASCII/Baudot conversion boards . . . and they use the same documentation for all of them!

Only by comparing the parts shipped with the parts list (which again does duty for three kits) and figuring out what everything on the schematic does is it possible to figure out what is needed for the GPA-B kit. For those who have trouble, a corrected schematic is given in Fig. 1. This modification contains additions and corrections (more on

Photo 1. What was shipped.

these later) but does not include the parts for different kits. Incidentally, I never did receive all the parts for this kit; fortunately, the missing ones were available locally. If this keeps up I may turn into a true hobbyist!

Now for the history of the kit. The circuit was originally published in *Radio Electronics* in March 1976. In the original publication there were a couple of errors, which were corrected the next month. Not all of these are corrected in the GPA-B (I presume that the folks at Mini Micro Mart do not believe in testing their kits before they put them into production and sell them).

I ordered the kit (for \$35), along with a surplus keyboard, in early February 1977. The key-

board came a few weeks later with a note that the GPA-B would be delayed about a week. After a month of waiting, I wrote the company to ask what had happened. No answer. Two months from the time the keyboard arrived, I again wrote. This time I was informed that the board had not been shipped because MMM didn't have any. They did have a similar board ... would I accept that? I said yes.

Three weeks later at a computer fair in Cleveland, I ran into Mini Micro Mart representatives who said they didn't have any of the boards yet (they had one as an exhibit and were taking orders for them), but that it wasn't their fault and they would ship one right away. They were obviously not too en-

thused about my scaring away customers, although a couple of other people at the show commented that they, too, were having problems with orders.

Two weeks later, still nothing. I called. Yes, they had them and one would be sent the next day. A few weeks later it came—over four months from the time I ordered it (prepaid, of course). I read the directions (half page), checked for non-plated-through holes with a magnifying glass (I should have used an ohmmeter) and built the thing—after going out and buying IC sockets. It didn't work.

First, I compared all parts with parts layout. No problem. Then, using an ohmmeter, I compared the schematic to the board. In addition to the un-

plated-through holes I had caught with the magnifying glass, there were 27 additional holes that had either been bad to begin with or had come unplated when I inserted the IC sockets. I repeat: *twenty-seven* bad plated-through holes. Ray later found three more; it would have been much easier if the kit had been sold as not having plated-through holes, then I would have soldered everything on both sides to begin with.

"Mini Micro Mart recognizes a responsibility to provide the highest quality components, whether sold as individual items or as part of a kit." So reads the manual. Yep. I might add that Mini Micro Mart not only recognized its responsibility to provide the highest quality components in the form of

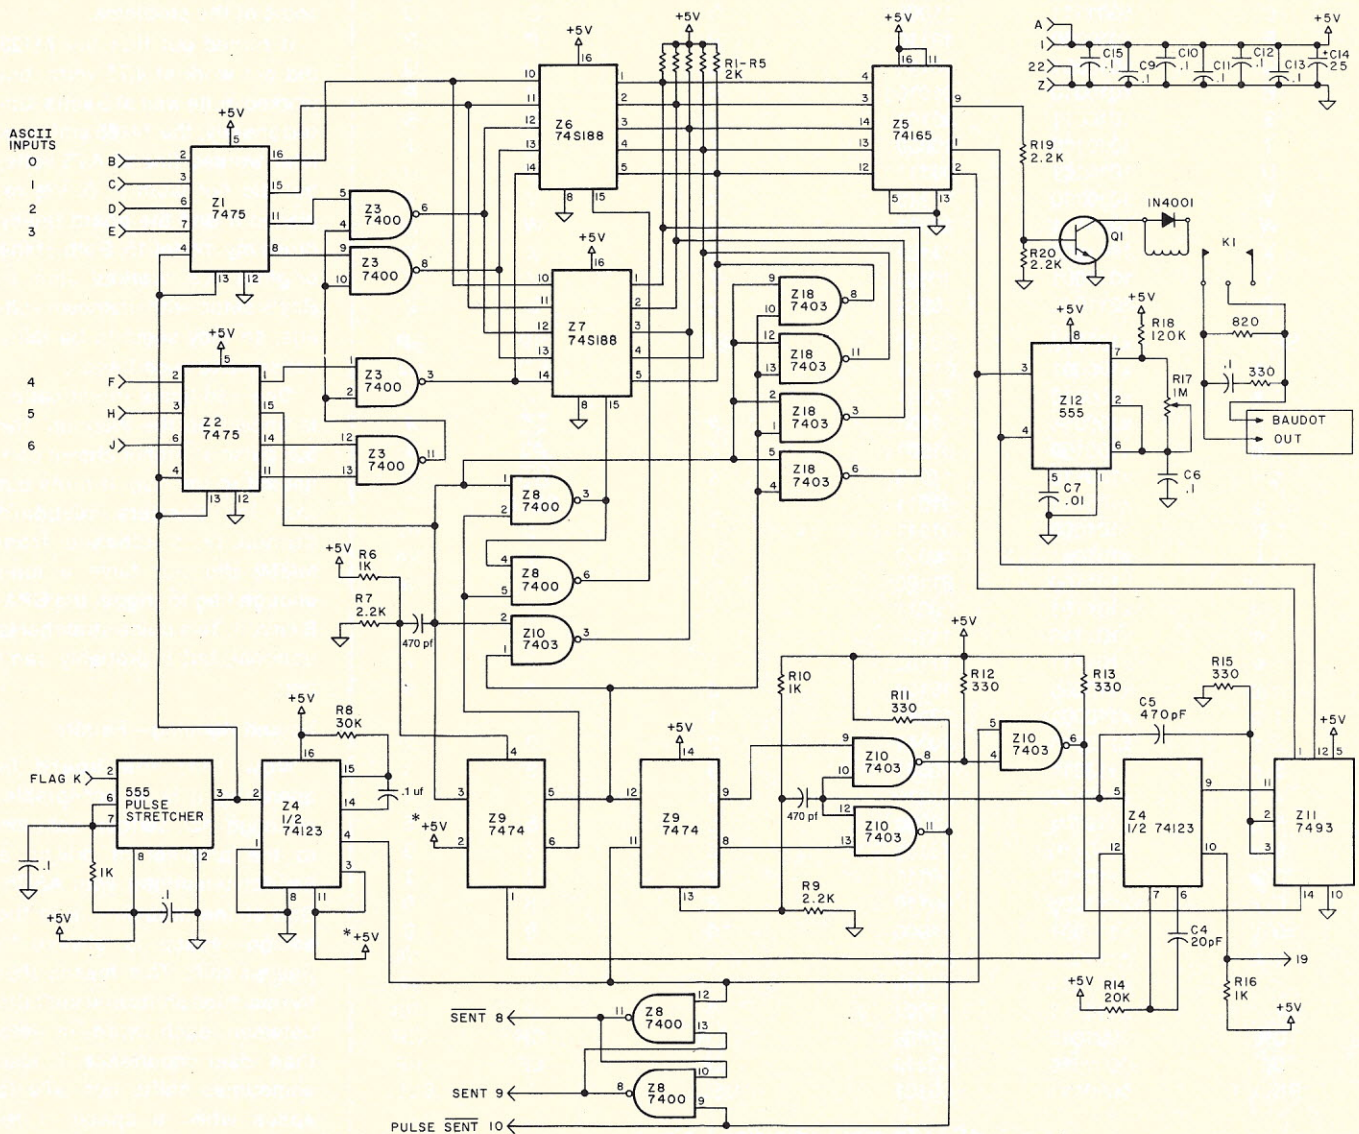

Fig. 1. Mini Micro Mart GPA-B ASCII-Baudot conversion board. Schematic modified by John Lehman and Ray Graham.

the board, but also included three bad ICs. We replaced them locally, rather than return them and risk waiting a couple more months.

After I had spent about 25 hours tracing pulses and soldering bad holes, I gave up

and called Ray. He found a couple more bad holes, two bad ICs, in addition to the one I had found, and two errors in the schematic. Error here means something more serious than mislabeling a part or misnumbering an IC pin, which also

happened.

The first problem was that the clear pins on the 74123 were left floating, rather than being tied high. Although not exactly an error, this is not considered good practice because the pins are susceptible to noise. They

were tied high as shown on the corrected diagram.

The second problem was that pin 2 of the 7474 was grounded rather than high. This causes the board to shift from figures to letters, but not shift from letters to figures. This was an error in the original unit. After many hours of work, Ray corrected the problem and brought the unit back to me.

I plugged it in expecting no problems. No such luck; I was plagued by the same problems that Ray had already solved. A couple of hours of circuit tracing were unproductive, but I did notice that the transformer on my bench supply was getting very hot. I checked the voltage with the GPA-B connected and read 4.75 volts. So I quickly built another supply with heavier components. This solved some of the problems.

It turned out that the 74123 did not work at 4.75 volts, but worked quite well at 5 volts. Unfortunately, the 74165 shift register worked fine at 4.75 volts, but did not work at 5. We replaced it and the board finally drove my model 15. Both of the original ICs worked fine in Ray's setup with unknown voltage, so they seem to be fairly sensitive to such things.

One additional modification is shown on the diagram: the 555 pulse stretcher shown connected to the flag. It turns out that my Sanders keyboard (ironically, purchased from MMM) did not have a long enough flag to trigger the GPA-B circuit. This pulse stretcher is optional, but it probably can't hurt.

Up and Running—Finally

Now that the board is operating, it is an acceptable, although not perfect, solution to the problem of driving a Baudot teleprinter with ASCII. One of the problems is in the design—space is always in figures shift. This means that the machine shifts and unshifts between each word—a less than ideal occurrence. It also sometimes shifts but fails to space when a space is received. If the board is run continuously for very long it gets

Fig. 2. ASCII-Baudot conversion table.

very hot, and sometimes prints garbage. All of that TTL draws a fair amount of current; you could almost fry eggs over the PROMs.

Photo 2 shows the result of the project—a model 15 that works in parallel ASCII. Fig. 2 shows the ASCII/Baudot translation performed by the board. For those who are unfamiliar with Baudot teleprinters, the reason for the three columns is that there are a number of different sets of figures symbols for Baudot teletypewriters. The three illustrated are the most common (aside from the weather keyboard, which contains numerous meteorological symbols).

The communications style is the unofficial standard and the style the GPA-B was designed to match. The CCIT is probably the most common commercial keyboard around at present. The Bell keyboard is found on old Telex machines. When assembling the kit, be sure to put the PROM labeled "L" (Letters) on the top of the board and the

PROM marked "F" (Figures) underneath it. This is not mentioned in the directions.

Conclusion

Ray has three boards from MMM (two of them from a PC-board supplier who no longer makes things for MMM). He got them a couple of years ago and has no complaints about the quality. None of these have been powered up yet, so I can't comment on how well they work.

I don't really enjoy troubleshooting hardware, especially when the problems come from other people's mistakes and carelessness. Had I worked overtime for the amount of time I spent on this kit, I could have bought another computer and done the conversion in software.

Considering delivery, quality and design, I shall let you guess when I will buy anything more from Mini Micro Mart. Of course, if the winter is cold enough, you never know what might freeze over! ■

Bowling Scores for Dollars

There's money to be made from this sport— and not just on the “bowling for bucks” TV shows. This article explains how.

Wow, what a package! This is very likely one of the best money-making ideas ever presented in the pages of Kilobaud. If you give it a go, we'd be interested in hearing about your successes (and failures). Joe Roehrig will be happy to provide a copy of the program if you send him a blank minidiskette and \$5. —John.

Now that my micro data-processing system has been up and running for a year, it is time for the system to earn its keep and generate profits. Computers are specialists in handling large volumes of figures in a fast, accurate manner. Thus, a small businessman with a DP system should search for an application that processes data for a third party ... saving the third party money while generating profits for the entrepreneur.

For the last 20 years, I have been bowling or scoring in bowling leagues. Up until a few years ago, scorekeepers manually tallied the scoring sheets for 50 to 75 cents per team per night. With 20 teams in a league, 36 weeks of bowling a year and a 50-cent rate, this fee comes to a modest \$360 annually.

However, if a bowling center has three leagues per day, seven days per week, the gross scoring revenues come to \$7560 per year. Taking this one step further, \$151,200 worth of revenue could be generated by

Leagues . . . know All There Is To know & More!

An established company wants you to have all of this data and more at your fingertips. That's why COMP-U-SEC 300 is prepared to offer you a new and exciting advancement to an outdated mode of maintaining statistics.

Now your league can have all of this and more, each and every week. Everything for the average cost of one candy bar for each bowler, each week, only 13c.

Our system is so new, so advanced and so unique, it will astound you! Today's most advanced computers and our highly skilled programmers will custom build the scoring system best suited for your league. Our system is designed for the league bowler, our checks and double checks leave no room for errors. Not only will you be assured of accuracy but you will also save your league money!

We can handle an unheard of number of leagues, but hurry; as you know winter leagues begin soon. If you're smart, you won't want to miss one week without COMP-U-SEC 300. Simply fill out the blanks below and send it to us, or let us know by phone where you are and we'll come and get it. There is no obligation. Learn today how you can benefit your league with the help of today's most advanced computers and technology at a price even your secretary will like, just 13c each week, each bowler.

COMP-U-SEC 300 is waiting to serve you and your league!

Fig. 1d.

Dear Manager,

We are happy to announce the start of a new service for bowling centers that can increase your revenue and facilitate the organization of bowling leagues within your center.

The service being offered is computerized statistics for your bowling league. Normally, this function is performed manually by a person who charges the league between 50¢ to 75¢ per team per week. Our service will be provided to the league through you at a cost of 35¢ per team per week. You, as the manager of a bowling center, can bill the league whatever amount you feel is appropriate. Assuming you charge the league 75¢ per team per week and have three leagues per day with 20 teams each, you would be increasing revenues by \$315 per week. Your profit would be \$168 and \$147 would be paid for our service. We used a 75¢ price to the league in our calculation since our service is superior to anything done manually.

What will you have to do? Very little. The following is a step-by-step outline of the easy procedure:

1. Return the enclosed postcard telling us how many leagues you want us to service and approximately how many teams in each.
2. We will send you forms to give out on opening night of your league. The bowlers will enter their names and average on these sheets. (After opening night your bowlers will never enter their names on a score summary again...our computer will print this information for the remainder of the season.)
3. Fill out a simple form describing the league's rules or send us the league rules. Give us a schedule or ask us to formulate a schedule.
4. Collect the forms.
5. We will collect the forms weekly from you for computer processing or supply an envelope for their mailing to us depending on your volume. At time of collection you will be required to pay for one week's data processing (35¢ per team).
6. The weekly statistics will be delivered to you.

We will attempt to verify all ABC averages and will prepare a year-end list of averages for ABC filing.

Regarding our background, the person assigned to this project has been involved in bowling, bowling scorekeeping and league statistics for nearly 20 years. We can handle any size league, any number of players per team and any set of rules. If you ever become dissatisfied with our service, you can terminate immediately and we will supply you all our data on your league.

Attached is a very short sample of a four-team league and a copy of a weekly score sheet to be filled out by the teams. These are just samples, and actuals will be on four-part paper.

If you want more details, give us a call or just return the enclosed postcard.

Sincerely,

Joseph J. Roehrig

Fig. 1a.

servicing 20 bowling centers.

The problem now is marketing the idea. The approach I recommend is to deal with the bowling center directly and share the revenue fifty-fifty. Why so generous? Because without the cooperation of the center to recruit leagues and to collect scores for the scoring service, there would be no revenues at all. Fig. 1a shows a sample letter that could be sent to numerous bowling centers. A second approach, advertising in bowling trade publications, is shown as Fig. 1d. A person with time to visit the bowling centers could do person-to-person marketing.

After reviewing Fig. 1 and thinking about your share of \$151,200, you should be ready to see how your new business

runs, assuming your marketing has been successful and the customers are clamoring for your service. (The tools I use for processing bowling scores are an Imsai 8080, North Star Disk, 24K of memory, DECwriter, an ADM3, North Star BASIC and the software contained in this article.)

The first question is how to store the data. Initially, my North Star Disk was generating a lot of hard-disk errors (a hardware problem later corrected by the local computer store). Therefore, the software design kept disk reads and writes to a minimum during program executions by assigning an area of memory exclusively for examine and fill (peek and poke in Altair BASIC) operations.

This article will not deal with

Fig. 1. The key to the entire operation lies in your marketing approach. Fig. 1a is a copy of the letter I sent out to various bowling centers. Fig. 1b is a sample of a four-team printout. Fig. 1c is a sample weekly score sheet to be filled out by the teams. Fig. 1d is a sample of another approach—an advertisement in a bowling publication (The Sports Reporter).

the detailed design of the software, but will show the reader exactly how to use the programs presented.

The Software Package

The first program in the bowling package sets up the bowlers' names, averages, sex and status (discussed later), which must be entered on a disk. The programs can handle any combination of up to 210 bowlers playing on as many as 30 teams. To avoid hard-disk error, this information was entered on a disk by writing a nine-line program (excluding data) that uses the bowling information as data statements. Thus, the North Star BASIC edit functions can be used to enter data and execute the program over and over again after it is written until a disk is properly prepared. Listing 1 shows this program.

Variable Z in line 1 represents the teams (1 to 30); Z1 shows the number of players on each team (any number as

Fig. 3. Input for program run 1.

Data Entry

The data for this program includes the eight-character team name, followed by eight-character players' names coupled to a five-digit number. Lines 5000 to 5003 of Listing 1 show the data for team 1. The five-digit number corresponds to each bowler's average, sex and status. Therefore, the first bowler in line 5000 is "Sue L," who has a 11710 following her name. The number breaks down as follows: 117—bowling average; 1—sex is female (11700 would be a male with a 117 average); 0—status.

Fig. 2 shows how the above program, "Setup 1," runs. For the first execution, a 1 is entered to clear memory location 30470 to 32767, which will be used for the actual scores. A 0 is entered for the next run and

long as the number of players does not exceed 210). Variable Z2 is 2 for a mixed league (both male and female players) or 1 for a league with only one sex participating. Z3 represents the number of games required by a status 0 bowler to establish an average; Z4 applies to a status 1 bowler. This allows the flexibility to require established bowlers to bowl a certain number of games to get a revised

average, whereas a different number may be required for new bowlers. Variable Z5 sets the maximum number of pins for an established bowler to lower his average. Note: Some of these variables are included in the bowling package to handle the more complex average calculations required by a few very sophisticated leagues that compete for high-prize money.

Fig. 5. Entering data from data-entry sheets (provided by various teams).

the computer asks for a file name. MIX 1 is entered and all the names are written in this disk file.

The main program, called RUN 1 (Listing 2), can now be executed. Fig. 3 shows how this program runs. It asks for the file location of the bowlers' names, the date, the week (1 for first week of bowling, 2 for second, etc.), the league lanes and which team is on each lane. The program prints the lane assignments; an input of 0 lets you change them in case of error. Finally, the program asks "set?" which allows you to set your paper to line one and push carriage return. Fig. 6 is the print-out which follows.

Fig. 3 gives the inputs for week 2. For the first run, you should enter 1 for the week and the computer will generate all blank forms. The blank forms are supplied to the bowling center as input sheets to be used. Fig. 4 shows how this blank form is filled out by the bowlers. The completed form is collected by the center and returned to you for processing.

Listing 3 is the input program—INPUT 1. Fig. 5 shows the data from Fig. 4 being entered into the computer. The program asks for the file name and then the team number. The computer then prints the name of each bowler. Enter the three scores and press return; a total is

printed by the computer for verification. This avoids input errors, since the total should agree with the input sheet.

To go to the next bowler push carriage return. Any character except a carriage return will cause the computer to ask for the same bowler's scores again. This allows for the immediate correction of errors.

Note that after Charlie in Fig. 5, scores are still solicited by the computer. This is done because an extra player was put on each team to provide for possible expansion. Next, the computer asks for the handicaps and, finally, for blind scores—scores not actually bowled but assigned to absent-

It's Here: Machine Language for the TRS-80

A description of a new monitor program from Radio Shack for the TRS-80.

Tired of playing blackjack with your TRS-80? Want to get down to serious business? If so, you've probably found that Radio Shack's 4K BASIC keeps you insulated from most of the Z-80's impressive capabilities. Wouldn't it be nice if there were some way to get out of BASIC and into the guts of the machine? Well, there is!

Radio Shack is now offering T-BUG, a 1K monitor program that permits you to use your TRS-80 as a *limited* development system. I have been playing with a copy for about a month now, and can report that it adds a whole new dimension to the usefulness of the machine.

Though I say limited, there is really no limit to what you can do with enough perseverance. However, it is only a 1K monitor, and as such, is roughly comparable to the 6800 MIK-BUG, or similar programs. I wouldn't want to develop a compiler with it, but it does open all kinds of doors most of us thought were closed.

T-BUG comes on a cassette and loads like any ordinary tape, using CLOAD. There's one profound difference—when the tape load is finished, you don't get the expected READY. Instead, you get a #, which tells you that you're free from BASIC!

How does this happen? As near as I can tell, each tape has a leader block, which not only contains the usual information, such as the load address and length of record, but also the

address at which execution is to begin. For all tapes generated by BASIC, this address is 0000, and thus has the same effect as a reset. On the T-BUG

tape, the address is the first instruction of T-BUG, which gets you going.

Now, without going any further into the details of the moni-

tor, we already have some intriguing possibilities—such as writing our own tapes with custom operating systems for special uses, or building a black box which simulates the input of that leader data.

I suppose I knew that there had to be some kind of system like this... how else could Radio Shack provide the assembler/editor tapes? Still, it's nice to know how to do it yourself. No, you can't write tapes with your own start address from T-BUG... it always starts at its own entry; but now you can get into the machine and make it do things your way!

Note that the CRT display occupies address space. The CRT video generation is totally transparent to the CPU. Just store an ASCII character in a location, and it's displayed. Incidentally, the arrows on the four cursor control keys are displayable as codes 5B through 5E. 5F is the cursor (_).

Note also that the keyboard occupies 256 bytes of address space, and a lot more if you count the unused space around it. This may seem wasteful, but, in my opinion, is the cleverest feature of the whole computer. We have all seen systems with a matrix-type keyboard. Typically, you put out an 8-bit word to an output port, which is latched and strobes the rows of the matrix. The columns are then read into an input port.

Radio Shack has reduced this concept to its bare essentials: There are no ports... the keyboard ties right across the

M nnnn	Displays the contents of location nnnn in hex. If you wish to alter the contents, merely enter the new data. The monitor will then display the next location, etc. To skip to the next location without entering new data, press ENTER.
X	Gets you out of the M mode. It also is used to abort other commands, such as when you type the wrong value for an address.
B nnnn	Sets a breakpoint at location nnnn. When control reaches this location, it will revert back to the monitor. The manual says only one breakpoint can be set at once. This is not strictly true... you can set as many as you want, but the monitor will only remember the last one.
F	Removes a previously set breakpoint. This is where the remembering comes in!
R	Displays the contents of the registers. All registers, including the program counter, stack pointer and index registers are displayed. The contents of these registers cannot be altered directly using R. However, it can be done if you need to.
P nnnn mmmm	Writes the contents of locations nnnn through mmmm to the cassette.
L	Loads a program from cassette. The program loads into the same locations it was written from.

When I got my copy of T-BUG, the first thing I set out to do was to explore the memory space of the computer. As a result, I was able to draw the memory map shown below:

0000-0FFF	4K BASIC monitor.
1000-2FFF	Empty ROM sockets for remaining 8K.
2000-37FF	Unused. (Usable???)
3800-3880	Keyboard.
3881-3BFF	Unused.
3C00-3FFF	CRT display RAM.
4000-7FFF	User RAM.
8000-FFFF	Expansion.

Table 1. T-BUG instructions.

address and data lines. When the keyboard is enabled by a high byte of 38, the low byte serves to strobe the matrix. Only one line of this byte can be high at one time, which explains why the keyboard takes up so much room. Only the addresses 3801, 3802, 3804, 3808, 3810, 3820, 3840 and 3880 are actually used.

Now, here's the great part: When an address line is high and a key in that row is depressed, the key ties the address and data lines together! This drives a data line high, and it is read as a byte with one high bit. In other words, to the CPU, the keyboard looks just like any other RAM. In this case, there is

Low Addr →	01	02	04	08	10	20	40	80

Fig. 1. Keyboard organization.

a considerable software overhead for decoding.

However, RS wisely made the right choices as to where to allocate software and hardware—use software where speed is not an issue (keyboard) and hardware where it is

(CRT). The organization of the keyboard is laid out in Fig. 1.

There are a few noteworthy points about this organization. First, the keys are essentially sequential in their ASCII order, so decoding is reasonably straightforward. Second, the

shift key is in a column by itself, so it can be used with any other key. I repeat . . . any other key, so if you wish you had not only lowercase, but also more special keys, you can get them. Would you believe shift-space bar? Finally, if you really want them, there's room in the matrix, if not on the keyboard, for five more keys.

As you can see, I've been having a lot of fun with T-BUG so far; and I've hardly begun to write software! It is a fairly limited monitor, in keeping with its size. If I had written it, I probably would have done things a little differently. And since I now have the capability, that's what I'm doing! ■

Two Systems Sharing the Same Bus

Distributed computing comes to microcomputers with this clever I/O system.

I believe this article is a first in computer-hobbyist publications. I don't recall ever seeing an article on interfacing two microcomputers. The technique is rather widespread in the world of the mainframes . . . but I suspect Mark is only one of a handful of people who have done it with personal systems.
—John.

Many computer hobbyists have experienced (or will someday) the ultimate frustra-

tion: a full bus. To the experimenter (with good financing) who delights in adding new gadgets to his computer system, a full bus means that new boards can no longer be plugged in with impunity. Now a decision must be made. Which old board will be removed to make room for the latest board?

One alternative to this horrible situation is to buy a new computer for the new boards.

Of course, all those neat boards in the old computer can't be used in both computers simultaneously, and a great deal of duplication becomes necessary. A better alternative is to expand the bus of the original computer onto a second bus with its own cabinet, power supply, etc. This solution allows simultaneous use of all the boards, but it is almost as expensive as buying a second computer.

Why not have the best of both alternatives? Extend your computer's bus by interfacing it to another microcomputer! This really isn't as difficult as it sounds, and it gives you the choice of either two independent computers or one larger computer. The two computers don't even have to be the same type, although things get more complicated with different CPUs. This article describes an interface between two different microcomputers that use the Motorola 6800 CPU, but the same basic ideas could be used to interface any two microcomputers.

Overview

I interfaced my two comput-

ers in an arrangement that allows either fully independent operation or master-slave operation. In the master-slave mode, the master computer takes over the slave-computer's bus and uses the slave's memory and I/O just as if they were on the master's bus. The mode of operation is under software control by the master computer.

My master computer is a Wave Mate Jupiter II. This is a nicely designed and executed system with many useful features. My expansion bus (the slave microcomputer), which doesn't need all the features of the master computer, is an SWTP 6800. Since both computers employ the 6800 CPU chip, much of the software I use with the Wave Mate (WM) can be modified to run on the SWTP. Moreover, the interface between two buses designed for the same CPU chip is only slightly more complicated than an interface between two identical buses.

The SWTP is almost ideal as a slave microcomputer—it is inexpensive, has a wide range of I/O available and is simple and easy to modify for DMA (di-

My two-computer system. The SWTP part of the interface can be seen in the last SWTP slot. The two interface cables run from this board, through separate openings in the back panel, down to the WM part of the interface.

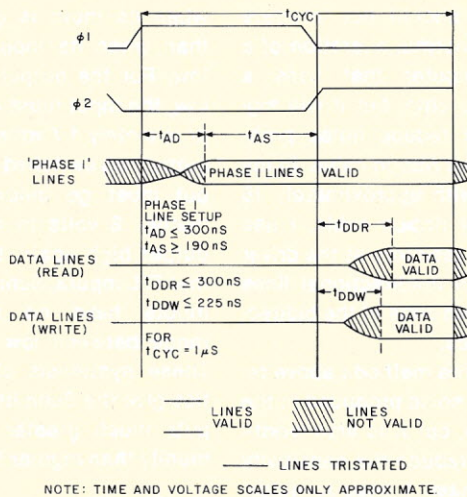

Fig. 1. Timing diagram for the M6800 microprocessor (from Motorola's M6800 Microcomputer System Design Data).

rect memory access) by halting. (The required modification will be covered later in this article.)

Since both microcomputers use the same CPU, the same basic signals must be used on both buses. While the WM uses a 72-line bus and the SWTP uses a 50-line bus, only 29 lines on the SWTP bus must be controlled by a DMA device. I used 33 distinct connections, including the ground connection, between the two computers.

Interface Considerations

Before we get into the specific interface design, let's consider how to get the bus signals between the two computers. Overcoming this problem, which is present in any bus extension, is probably the most critical part of the interface design.

Suppose you need to interface two identical motherboards. Why not use a ribbon cable to connect the buses line for line? This seems to be a simple, inexpensive way to extend the bus. Unfortunately, unless the cable is very short, it will not work.

The wires in a ribbon cable are too close together and have too little surface area to use as a computer bus. As a result, the signals on one line will induce noise on the other lines. The faster the signals on the lines change state, the larger the current flow in the lines, and the longer the lines, the greater the

induced noise problems. If the noise is enough to change the logic levels on some of the lines, chaos results.

The 6800 CPU synchronizes the changes in level of the address lines, VMA (valid memory address) and R/W (read/write) with the phase 1 clock signal. All these lines may change state only during the first part of the machine cycle. The data lines are synchronized with the phase 2 clock signal. They change state during the second part of the machine cycle. See Fig. 1 for a diagram of these timing relationships.

The noise induced by the changes in the lines synced by the phase 1 clock is not likely to interfere with normal computer operation. Fig. 1 shows the signals on the lines synced by phase 1 are not valid when these changes occur, and the data lines, synced by phase 2, are in a high-impedance state. Unless the noise pulses cause ringing in the lines or are large enough to damage the ICs attached to the lines, they will not upset the operation of the computer.

When the data lines change state, noise may be induced on the lines synced by the phase 1 clock. The signals on these (control and address) lines must be valid during the last part of phase 1 and all of phase 2. Since the data lines change state during the first part of phase 2, noise may be induced on the phase 1 lines at a time

when they must be valid. If they're large enough, these noise pulses can really mess up the computer's operation.

The Ribbon Cable

Several approaches can be used to minimize noise between the lines of the ribbon cable. Because noise problems can be extremely difficult to track down and fix in an existing design, I used an overkill approach, involving three different methods to minimize the noise in the ribbon cable.

1. Since the induced noise falls off rapidly as the conductors are moved apart, I separated the data lines from the other bus lines. I used two cables to carry the signals between the computers with spacers to keep them apart. A 26-conductor ribbon cable carries all of the phase 1 synced signals and a 16-conductor ribbon cable carries the data lines.

2. I partially shielded the data lines by alternating them with

ground lines in the 16-conductor cable. This cuts down on the amount of noise radiated by these lines. These eight ground lines are the only ground connections between the computers. This probably would not work if the ribbon cable had to carry the actual bus signals, but, as we shall see, it does not.

3. I used drivers and receivers on all lines running between the two computers, except for the ground lines and one line used to initialize the halt control circuitry. This means that the ribbon cable does not need to carry much current, and that the current-limiting resistors can be used to limit the rate of change of the signals on the cable. It also means that the ground connection between the computers carries little current.

The ribbon cable conductors look, to the drivers, like a complicated network of capacitance, inductance and resistance. To change a line from its low level to its high level, its

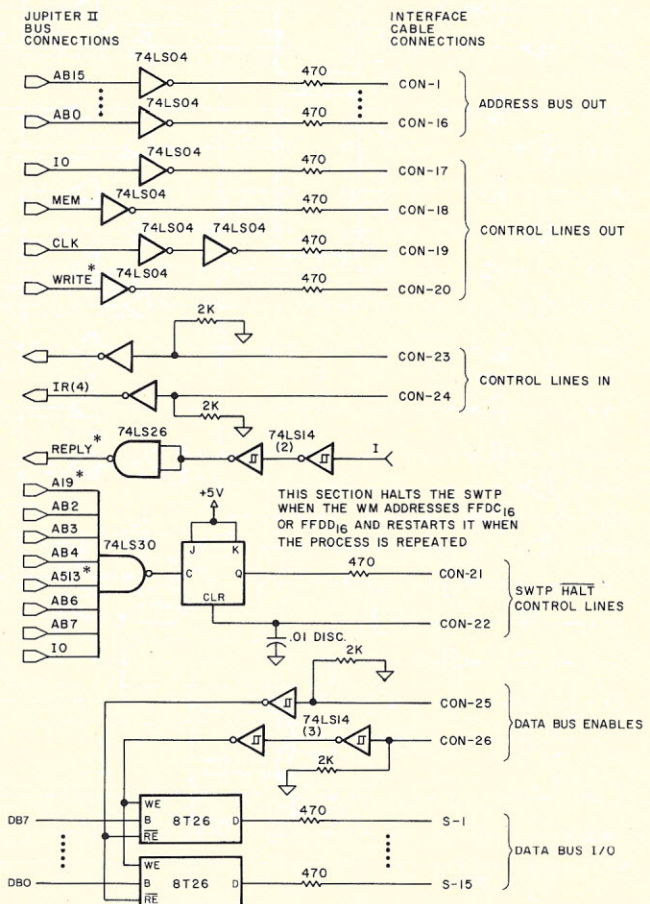

Fig. 2. Wave Mate Jupiter II to SWTP 6800 interface: WM section.

equivalent capacitance must be charged by the driver. To change it from high to low, this same capacitance must be discharged. The resistance and inductance in the line, as well as the output current capabilities of the driver, determine the rate at which the line can be charged or discharged. For high-current drivers (e.g., 8T26s), and moderate lengths of cable, the time constant for charging or discharging a line is a few nanoseconds (ns) or less.

Microcomputer bus lines do not need to change state in ns. Typical allowed setup times for bus lines on the 6800, using a 1 MHz clock, are 150 to 200 ns. Since noise problems increase with increasing rates of change on the bus lines, it makes sense to slow the lines down to the

rate needed by the computer system.

Current-limiting resistors can be connected between the drivers and ribbon-cable conductors to limit the rate lines can be charged or discharged. The receivers I used require less than .2 mA of current flow in the ribbon cable for proper switching. This means that if a .5 volt drop is the maximum allowed across the resistor, the resistor could be as large as 2.5k.

Since typical ribbon cable has an interwire capacitance of 10 to 20 pF per foot, the capacitance seen by the drivers will be on the order of 20 pF. A 1k resistor in series with a 20 pF capacitor will allow the capacitor to charge to 98 percent of any voltage applied across the combination in less than 100

ns. This should not interfere with the normal operation of a microcomputer that uses a 6800 CPU chip, but it will significantly reduce noise problems in the ribbon cable. In my design, with approximately 18 inches of ribbon cable, I use 470 Ohm resistors at the driver end of all unidirectional lines and at both ends of the bidirectional lines.

The three methods above reduce the noise produced in the bus lines, but it is also worthwhile to reduce the sensitivity of the phase 1 lines to noise. Since we are using a driver-receiver scheme, we can use receivers that have a high noise immunity. TTL Schmitt trigger input inverters are ideal for this purpose.

The TTL Schmitt trigger has a different switching threshold

when its input is going high than when its input is going low. For the output to switch low, the input must exceed approximately 1.7 volts. Once the output has switched low, the input must go below approximately .8 volts to switch the output high again. Unlike normal TTL inputs, Schmitt trigger inputs have no disallowed range between low and high. These hysteresis characteristics give the Schmitt trigger inputs much greater noise immunity than regular TTL inputs.

The Circuitry

Now let's look at the Wave Mate to SWTP interface design. The schematics for the two parts of the interface are given in Figs. 2 and 3. Fig. 2 shows the logic located in the WM and Fig. 3 illustrates the logic in the SWTP. The two connecting cables are denoted by Con (the 26-conductor cable) and S (the 16-conductor cable). I haven't shown the ground connections (every even-numbered line in S) or the repeated circuitry in the address lines and data lines.

Most of the logic to convert the WM bus signals to the SWTP bus signals is located in the SWTP. This is because only half of a WM board was available for use in the interface. In any case, it makes sense to put as much interface as possible in the slave computer where it will use power only when the slave is in use.

In addition to reducing noise problems, the driver, current-limiting resistor, receiver design also allows simple circuitry for independent use of the computers. When one computer is unpowered, the current-limiting resistors prevent excessive current flow from the drivers in the other computer. For fully independent operation of the two computers with the interface, 2k pull-down resistors were installed on four of the 74LS14 inputs on the WM board and one on the SWTP board. These resistors prevent the interface from interfering with the operation of either computer when the other computer is not powered or the interconnecting cables are dis-

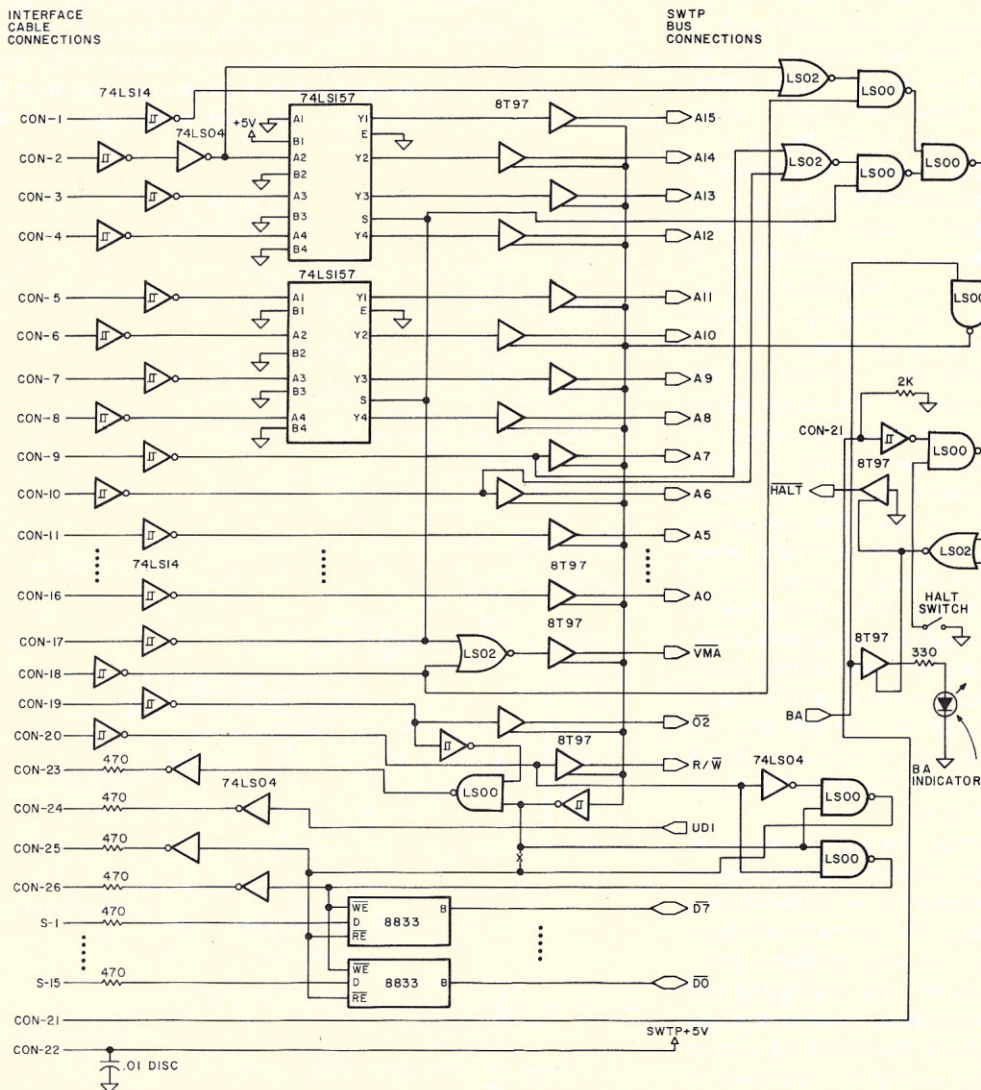

Fig. 3. Wave Mate Jupiter II to SWTP 6800 interface: SWTP section.

modem / 'mo • dəm / [**modulator**
+ **demodulator**] *n* - *s* : a device for
transmission of digital information
via an analog channel such as a tele-
phone circuit.

Those of us who live on the North American continent are blessed with an incredible non-natural resource consisting of a gigantic web of tiny copper wires linking virtually all of our homes and businesses together into the greatest telecommunications network in history. The Bell System and over 1600 independent telephone companies have been stringing wires and microwaves nearly everywhere for up to 100 years. Now, the 80-103A Data Communications Adapter brings this amazing network to S-100 Micro Computers.

The 80-103A Data Communications Adapter is more than just a modem. It is a complete data communications sub-system combining on a single S-100 board functions which formerly required a modem, an automatic calling unit, and serial and parallel interfaces. This fully programmable unit gives you flexibility never before available at such a low cost. Fully assembled, tested, and burned in with full documentation and our standard 90 day warranty, the 80-103A is available at retail computer stores across the country for only 279.95.

YES, it's improved.

YES, it's the same price!

At \$35, the Mullen Extender Board Kit with built-in logic probe has always been a great value...but when it came time to crank up a new production run of boards, we couldn't resist adding a few small changes here and there to continue staying ahead of the pack.

For example, our logic probe now reads out into a 7 segment readout; we've also included a pulse stretcher and a light whose brightness is proportional to the duty cycle of a pulse stream (activates when probe reads H or high). There's a general-purpose breadboard area where you can develop circuits unique to your needs, with holes punched on a .1" grid. The edge connector is not only easier to mount and virtually self-aligning, but also allows use of scope hooks...we could go on, but that's enough for now. **Check out the new Mullen Extender Board at your local computer store today, or order by mail (Cal res add tax) from:**

MULLEN COMPUTER BOARDS

BOX 6214, HAYWARD, CA 94545

connected.

The interface uses 26 unidirectional lines to carry information from one computer to the other. Twenty-one are used to supply information to the SWTP. The other five lines carry information to the WM from the SWTP. We will discuss these lines in more detail later.

The bidirectional lines (data lines) use 8T26 inverting bus transceivers at the WM end and 8833 noninverting bus transceivers at the SWTP end. The interface must invert the data between the two buses because only the SWTP uses inverted data on its main bus.

This is a good time to mention some points about the logic notation used by SWTP and WM. Logic levels can be defined in two ways—TTL high is usually considered as true and TTL low is considered as false; it is equally valid to define TTL low as true and TTL high as false. Using this negative, or inverted, logic changes the functions of most logic gates (e.g., a NAND gate becomes a NOR gate when the logic definitions are inverted).

Since it is convenient to mix both true and inverted logic definitions in any complicated logic design (it makes the design simpler), some convention must be followed in naming the lines to indicate their logic definition. SWTP uses an overbar to indicate that TTL low is defined as true; WM uses a superscript * for the same purpose. WM data lines are called DB0-DB7, indicating high level true, while SWTP data lines are called $\overline{D0-D7}$, low level true. Other examples are the WM WRITE* line, which write enables the memory and I/O when it is low, and the SWTP BA line, which indicates the SWTP bus is available when it is high.

Several control signals from the WM bus must be modified before being placed on the SWTP bus. CLK, the WM phase 2 clock signal, must be inverted to serve as $\overline{\phi 2}$ on the SWTP bus. MEM and IO, used by WM for enabling memory and I/O devices, must be combined (using a NOR gate) to provide \overline{VMA} ,

which the SWTP bus uses for both purposes.

Memory and I/O Access

It is convenient to have the interface modify both memory and I/O port addresses. This allows both computers to see their own memory starting from 0000 and, in my setup, extending to 3FFF. The WM, however, sees the SWTP memory from 4000 to 7FFF and uses locations FF00 to FFDF for output ports, while SWTP uses 8000 through 801F. The interface allows it to address the SWTP output ports as if they were located from FF00 to FF1F on the WM bus. This allows the WM monitor, which assumes I/O ports are located from FF00 up, to be used with the SWTP I/O devices.

I used data-selector logic to get different offsets for memory and I/O addressing. The 74LS157 quad 2-line to 1-line data selectors act as 4-pole double-throw switches. Two 74LS157s are used in the interface to allow the WM IO line to control the offset in the address placed on the SWTP bus. When IO is high, indicating that the WM is addressing its I/O ports, the B inputs on the data selectors are selected. These inputs are hard-wired to give an address of 80XX. When IO is low, the A inputs are selected. These inputs have A15 wired low and A14 inverted from the WM bus.

These address-line modifications shift addresses in the range 4000 through 7FFF on the WM bus to 0000 through 3FFF on the SWTP bus. WM addresses not in the range 4000 to 7FFF or FF00 to FF3F will not enable the interface and can be ignored. The upper limit of 7FFF is necessary in my system to prevent interference with the WM video display memory at 8000 to 87FF. The display memory could be relocated (by reprogramming one of the monitor EPROMs), and all 32K of the SWTP memory space made accessible with minor changes in the interface logic.

The enable circuitry for both memory and I/O access to the

The complete interface. Only the two rear rows of the WM board (bottom of photo) are used in the interface. The other two rows are a WM serial interface.

SWTP bus requires that BA be high, which means that the SWTP A board is either halted or not plugged into the bus. Additionally, when BA is high, AB15 is low, AB14 is high and MEM is high, the 8T97 drivers on the SWTP bus are enabled for memory access. When BA and IO are high, AB7 is low and AB6 is low, the drivers are enabled for I/O access.

The data bus drivers are enabled whenever the 8T97s are enabled, but the direction (read or write) depends on the WRITE+ line. The enable signals for the bus transceivers are generated and used on the SWTP interface board, but they must also be sent to the WM board to control the transceivers there.

Both the 8833 and 8T26 bus transceivers have their bus input and output terminals connected to the buses. This means that when the 8833s are enabled to write to the SWTP bus, the 8T26s must be enabled to read from the WM bus. Therefore, the read enable line for the SWTP becomes the write enable line for the WM, and vice versa. The 8833 enable inputs for both reading and writing are active low, but the 8T26 enable for reading is active high (the enable for writing is active low). I inverted the read bus line from

the SWTP on the WM board before sending it to the 8T26 write enable input.

The RPLY+ line is used by the WM to allow stretching the WM CLK signal when accessing slow memory or I/O chips. The WM CLK signal is held high (up to 3.5 microseconds—us) until approximately .5 us after RPLY+ goes low. Since the SWTP devices must be fast enough for a 1 MHz clock, RPLY+ is pulled low by the interface whenever it is enabled and CLK is high.

The Master-Slave Relationship

Now let's look at how the WM can halt the SWTP when it wants to use the SWTP bus. The 6800 chip allows DMA by three different methods: halting, cycle stealing and multiplexing. The simplest method, and the only practical one using the SWTP, is halting. The SWTP MP-A board, which contains the CPU, the clock and the MIKBUG ROM and RAM, is designed for DMA by halting, but it does require a very minor modification for full DMA. Before we discuss the modification, let's look at how DMA by halting works on the 6800.

The 6800 microcomputer is halted, logically enough, by pulling the HALT line low. This line may not change state ex-

NEW F-8 SYSTEMS

F-8 CPU Board S-100 Compatible

Complete with 3850 CPU and 3853 SMI. Provides sockets for 2K of EPROM monitor, two PIO sockets and connections for six I/O ports. 64 bytes of scratch pad RAM, and fully buffered data bus.

cept during the first part of the machine cycle, but SWTP has provided a flip-flop, clocked by the phase 1 clock, on the MP-A board to satisfy this requirement. Therefore HALT, the SWTP bus line, can be pulled low or allowed to go high at any time. When low, the 6800 will complete its current instruction, remove itself from the bus and then set BA high. This process can take from 2 to 15 us, depending upon the current instruction.

The delay between pulling HALT and actually having the bus available (BA high) means that we cannot simply pull HALT and simultaneously use the bus. Some means of latching the SWTP into its halted state must be used. I used a flip-flop on the WM board for this purpose. When the WM addresses FFDC, the flip-flop is clocked, causing its output to change state. The output is connected, through a unidirectional line, a NAND gate and an inverter, to the enable input of an 8T97. This pulls HALT low when it is enabled and serves as a driver for the BA LED indicator on the interface board. The other input of the NAND gate is connected to a switch on the board to allow manual halting of the SWTP.

The CLR input on the flip-flop is connected to +5 volts from the SWTP board. This initializes the flop-flop to the non-halted state when the WM is powered up before the SWTP. It is important to allow the SWTP to initialize itself before it is halted, even if its CPU is not going to be used.

Although the SWTP MP-A board appears to have been designed for DMA by halting, the circuitry to control the data bus drivers when the CPU is addressing the MIKBUG ROM or RAM prevents a DMA device from reading from the bus. A simple circuit modification corrects the problem without interference to normal computer operation.

Two different logic paths are used by SWTP to control the direction in which the data bus transceivers are enabled. This is necessary because the data

lines to the MIKBUG memory are connected directly to the CPU data lines rather than the data bus. When MIKBUG is addressed by the CPU (addresses EXXX or AXXX), the normal logic path is overridden by the MIKBUG path. The transceivers are now enabled to write to the bus while the CPU uses the MIKBUG memory. Since none of the boards on the bus are enabled at this time, the data on the data bus are ignored.

When the computer is halted, the normal logic path is disabled, but the MIKBUG path is still active. When the R/W line is low (DMA device writing to the bus), the transceivers are enabled to read from the bus. This does not cause any problem. When the R/W line is high, the data bus transceivers are enabled to write to the bus, regardless of the address on the bus. This means that when the DMA device tries to read from memory or I/O on the bus, data bus drivers on both the board addressed and on the MP-A board are enabled. A prime rule of bus usage, "Thou shalt not have more than one set of drivers enabled at any time," is violated, and only garbage can be read from the bus.

To correct this problem, keep the data bus transceivers in a read from bus mode when the computer is halted. The first gate in the MIKBUG read/write circuit is a NAND gate used as an inverter by wiring its inputs together. When the output of this gate is high, the data bus transceivers are held in the read from bus mode. Since a NAND gate will have a high output when any of its inputs are low, separate the two inputs and use one to hold the output high when BA is high. A line that is low when BA is high is available, conveniently, on the same IC.

The NAND gate is one-quarter of IC12 on the SWTP MP-A board. Pins 4 and 5 of this IC are the inputs tied together to make an inverter, and pins 1 and 2, also tied together, have a line connected to them that is low when BA is high. I cut the foil connecting pins 4 and 5 and ran a short length of insulated wire

Fig. 4. Modification to MP-A board to cure noise problem on SWTP HALT line.

from pin 4 to the line coming into pin 1. When BA is high, this modification keeps the transceivers in the read from bus mode, but, when BA is low, the NAND gate acts like an inverter, just as in the unmodified circuit.

With this modification (or, for that matter, without it), the interface cannot read or write the MIKBUG ICs. Because of the MP-A board's design, no DMA method can use the MIKBUG ROM or RAM without added circuitry on the MP-A board. Because of the difficulty of modifying this board, I suggest that if you need this capability you relocate the MIKBUG circuitry to some other card in the system (e.g., the interface card).

One of the ways I hope to use my slave computer is as an I/O controller for the master computer. By connecting all of my slow I/O devices to the slave computer bus and programming it to handle the printer, cassette, etc., which often take the majority of a microcomputer's time, the time available to the master computer to do calculations and data manipulations is greatly increased. There is nothing original about this idea; I suspect all large computers work this way.

To make the interface more flexible, I've incorporated a line that allows the SWTP to inform the WM whenever it needs attention. When the SWTP addresses its 0 I/O port, the WM gets a signal on its #4 interrupt line. Since the WM uses a vectored, maskable interrupt scheme, it can be programmed to go to an I/O service routine when it is ready for I/O and the SWTP has indicated, by inter-

rupting, that it is waiting to be serviced.

Bugs

I have used my two-computer system for approximately two months, and only one problem has come to light: a noise problem in the SWTP! The HALT line, as I mentioned earlier, uses a flip-flop on the MP-A board to synchronize changes in the HALT line with the phase 1 clock. This is a TTL device that will respond to very short pulses on the bus line. I discovered that noise on this line was causing the SWTP to execute occasional single-cycle operations.

Fortunately, the cure for this problem was simple. I inserted a low-pass filter into the line on the MP-A board before it reaches the flip-flop (see Fig. 4).

This problem was due to noise pulses originating in the interface, not on the SWTP bus. It will not cause trouble if the SWTP is halted by means of a switch connected directly to the bus line and ground with short, reasonably large, wires.

Summary

Few, if any, will want to build an exact copy of my interface. However, the basic interface design and many of the ideas are applicable to anything from adding a bus to a one-board microcomputer to interfacing two microcomputers using different CPU chips. This is a wide-open area for hobbyist exploration.

Many people probably feel that interfacing two different computers is too complicated for anyone without an extensive technical background. Actually, if the two computers use the same CPU chip, it is a straightforward and rewarding project. It took me less time to design and build the interface between my two computers than to build an RS-232 interface for my keyboard/printer. All of the critical timing relationships are already taken care of by the computers. All you must do is get the signals between the computers and modify those signals that are different on the two buses. ■

Computers in Classrooms: Teaching the Teachers

Three big markets for personal computers will exist in years to come: small businesses, homes, schools. Educating the educators is something we can all get involved in.

Photo 1. A large computer installation.

(Courtesy of IBM)

Today there is no reason why every elementary and secondary school should not have computers. Their potential uses are obvious and their cost is remarkably low. But widespread use of computers in classrooms will come only when teachers realize their value. This article discusses the possible uses of computers in classrooms, and describes workshops my associates and I have held for local teachers. My aims, here, are to present the criteria for these workshops, discuss the problems that we faced in organizing them, describe what we learned from our experiences and encourage others to help in this task of "educating the educators."

Facing the Problem

Any reader of this magazine is certainly aware that computers will soon be as much a part of daily life as typewriters, refrigerators, automobiles and television sets. Such everyday items surely must be part of classroom education at all levels. Students must grow up with the computer much as they grow up with the other

products of our culture.

But the computer is not only a new household item, it is also a versatile tool that can aid in education. Computers can handle routine tasks such as grading and record keeping; help in generating class materials and providing self-paced review; and even supply simulated experiences ranging from simple games to complex system tasks. The possible uses of computers in education are unlimited. Now the sharp reduction in the cost of computers has made many of these uses economically feasible.

One obvious problem is that few teachers have the background required to take advantage of computers. Even science and mathematics teachers have seldom had more than a cursory (and often outdated) introduction to computers. These introductions typically treat the computer as a high-powered calculator, capable only of solving mathematical problems. Most teachers share such common public myths as:

1. Computers are intelligent and answer all questions posed

Photo 2. The Electronic Product Associates Micro-68 (exploded view shows components). (Courtesy of Electronic Product Associates)

to them (presumably in an eerie metallic voice).

2. People who work with computers must be wizards or mathematical geniuses. Computers remain remote and mysterious to the "man on the street."

3. Computers are depersonalizing, unimaginative and insensitive. Furthermore, they will eventually take over everything.

4. Computers are always right, or at least think they are. Somehow, though, they can always be outsmarted by a few extraordinary (or even ordinary) people.

5. Computers are large, very expensive and very complex. Average people can only look at an installation like that shown in Photo 1 from behind closed doors.

Even teachers who have some computer background are often unfamiliar with the new, low-cost microcomputers. Since teachers are already expected to be expert in sociology, anthropology, psychology, ecology, health and other subjects, this lack of familiarity can hardly be surprising.

On the other hand, most computer specialists (like myself) are unfamiliar with the problems of elementary and secondary teachers. Their needs and requirements are different from those of teachers at the college level. Elementary and secondary teachers need

solutions to their problems, not just new tools that are difficult to use or understand and will simply clutter the classroom.

The Role of Computer Clubs

The personal-computer movement has some unique characteristics that can be used to solve this educational problem.

- Many personal-computer enthusiasts are newcomers to computing. They can therefore help alleviate fears that only experts can understand computers. Many computer-club members are themselves teachers.

- Personal-computing stores, magazines, conferences and clubs cater to the novice. They provide information at a variety of levels. Furthermore, other hobbyists are often willing to help novices.

- Personal computers are not financially out of reach for most schools. Complete units can be priced as low as \$600, a cost comparable to that of a typewriter or television set.

- Personal computers are designed to be used by non-experts. Their size, appearance and operating methods make them far less forbidding than larger computers and far easier to explain.

Planning a Workshop

The potential for personal computers in the classroom is there but how do you translate

it into reality? The rest of this article will deal with our experiences in offering personal-computer workshops to teachers. I hope you'll get some idea of approaches to take and pitfalls to avoid.

The original idea grew out of a microprocessor course I offer at Grossmont College. Although the course is primarily intended for engineers and technicians, many hobbyists also take it. Among my students was Dr. Russ Cassel, a well-known specialist in computer-aided instruction who is presently retired from the U.S. Air Force and from a professorship at the University of Wisconsin, Milwaukee. It was Russ who suggested we hold a workshop for teachers.

Since I am interested in continuing education and have given some workshops for engineers, I decided that the idea was worth pursuing. Our group finally decided on the following guidelines:

1. We would not assume that attendees had any previous background in computers.

2. We would emphasize the current state of the art in low-cost computers.

3. We would try to emphasize that you didn't have to be either an expert or a mathematical genius to use a computer. One approach would be to have

local teachers and other non-experts explain how they were using computers.

4. We would try to give all participants some hands-on micro-computer experience.

5. We would hold all-day Saturday workshops at no charge.

Our net assets when we started were:

1. Cooperation from Grossmont College, which provided a room, reproduction of materials and some secretarial help. This was largely arranged by Dr. David Lien.

2. Cooperation from a local microcomputer manufacturer, Electronic Product Associates. This manufacturer agreed to supply us with some Micro-68s for the hands-on experience. The EPA Micro-68 is a Motorola 6800-based microcomputer that has a hexadecimal keyboard and display (see Photo 2), and can therefore be used without a terminal. It is also available in more elaborate configurations (see Photo 3) with various peripherals.

3. Help from some local computer enthusiasts, including present and former teachers.

Finding Willing Victims

What we lacked (besides good sense) were teachers (i.e., guinea pigs for this experiment). The obvious place to start was at nearby high

Photo 3. The Electronic Product Associates Micro-68b, a larger version of the original Micro-68. A printer, TV interface, cassette interface and floppy-disk system are available with this computer. (Courtesy of Electronic Product Associates)

WHATSIT™

A "DATA BASE MANAGER" FOR YOUR MICROCOMPUTER

Much of the untapped potential of computers lies in their ability to store "data bases" of constantly changing information, and to permit convenient, timely access to it through a one-to-one "conversation" with the person who needs it. Used as a "Data Base Manager," WHATSIT can support a disc-resident data base and process queries (as well as updates) in a real-time conversational mode.

APPLICATIONS

Easily implemented on a small desktop computer with as little as 24K of total memory, the WHATSIT system can be used in applications like these:

- A salesperson may need to store customer and prospect lists, buyers' names and phone numbers, current order status.
- A professional person may need to index client records, appointment schedules, or technical data needed for frequent reference.
- A contractor might want quick access to material prices and specifications.
- A manufacturer's data base might include customers and suppliers, and recent price quotations issued and received.
- An investor might want to keep tabs on a portfolio of securities, with purchase dates and tax basis information.

OPERATING SIMPLICITY

In response to pidgin English "Requests," WHATSIT can store, index, and retrieve information about one or several aspects of your business, hobby, or other application. You are free to intermix unrelated data on a single disc, or to "dedicate" an individual disc to each of a variety of applications.

Since file indexing and disc space allocation are performed automatically, the system can be used without learning complex procedures. And since both queries and updates are processed within a single program, there's no need for the inconvenience and delay of a "menu selector," or for manually switching from one program to another.

In contrast to many programs, WHATSIT does not require you to commit yourself in advance to particular data structures, or "record formats." The file structure is never frozen, but develops automatically to adapt to your requirements.

DYNAMIC FILE RESTRUCTURING

This "dynamic restructuring" of the data base takes place through normal use of the system, without operator intervention or reprogramming.

This is how it works: Whatever information you wish to store is automatically cross-indexed under "Subject" and "Tag" headings you designate. Using WHATSIT's pidgin English Requests, you may add or change headings, as well as data, at any time. Because the system maintains headings in disc storage, they may be changed readily by the program itself.

CONVERSATIONAL QUERY CAPABILITY

Data retrieval is equally easy. You can query the system directly about any data item on file, or you

may inquire about any heading. All that's required is a pidgin English "Request," such as "WHEN'S DR. JEKYLL'S APPOINTMENT?" System response time is usually a matter of seconds.

Up to two headings may be specified in a single Request; a capability that makes possible versatile cross-indexing within the data base.

INSTALLATION

For easy installation, the WHATSIT programs are supplied in the widely available North Star BASIC, and can be installed without modification on any S-100 bus (8080 or Z-80) computer equipped with a North Star disc system and at least 24K bytes of random access memory (RAM). For other disc systems or non-compatible computers, the programs would require modification.

SPECIFICATIONS

MODEL NS-3, Version 1

Hardware compatibility: Any S-100 Bus (8080 or Z-80) computer with one North Star disc system and 24K of RAM (random access memory).

Language: North Star BASIC, Version 6 Release 3. Request types: Store, Scratch, Change, Add, Spill (6 types including Indexed, Selective, and Analogy), plus special Requests.

Response time: Normally 3 to 10 seconds. File capacity: 1500 to 3000 entries per disc, depending on average entry length.

Indexing: Every entry automatically indexed by Subject, Tag, Object. Request length: Up to 100 characters. Entry length: Up to 30 characters.

WHATSIT is available for \$75.00 as a Ready-to-Run System, including three programs on Northstar disc and a 100-page user's manual written in non-technical language. The manual may be optionally ordered for \$25.00. Besides detailed startup and operating instructions, the manual includes complete programs listings in BASIC.

headware
CREATION

Photo 4. The Computer Power and Light COMPAL-80 Microcomputer. This system comes completely assembled, including the keyboard and TV monitor, for about \$2300. Printers and floppy disks are available at extra cost. (Courtesy of Computer Power and Light)

schools; so we started to wade through the various bureaucratic levels. Surprise—the people at the first school we contacted were positive and enthusiastic. They had been using a time-sharing system and were anxious to learn about micros. This response was, of course, encouraging, and it turned out to be the only encouragement we would receive from any school.

The general response was: "What are you trying to sell?" "The person who handles computers is on vacation." "We're busy right now with exams, parent-teacher meetings, law enforcement, football, etc., but do call us back (preferably when we're out)." "I'll route the matter to our mathematics coordinator; he (or she, or it) will get back to you. But don't hold your breath."

The lesson here is that you'll need some patience (and some aspirin). Teachers are not lining up, waiting to find out about computers. You have to reach them and sell them on the idea; and that takes time and effort. A few notices or a few telephone calls will not do the job.

Fortunately, we wanted to start small and we had no illusions about a huge crowd. (Remember that we wanted to include hands-on experience.) In fact, our initial group was fifteen, padded by two deans from Grossmont College and a

few ringers from the local computer club.

The Initial Program

The program consisted of two talks: one by me and another by Dr. Melvin Zeddies of United States International University. Mine, "An Introduction to Computers," described what a computer was, what made up a working system, what was presently available and how much it cost, what the future trends might be, where you could get more information, and how you might want to use a computer in the classroom. Copies of the slides are available from me for anyone who is interested.

Dr. Zeddies talked about his experiences in building several small computers for use in a high-school program for gifted students, covering such matters as how to obtain funding, build and maintain the computers, write programs, and provide some continuity in computer operations.

In addition, three local computer enthusiasts—Gary Mitchell, Laura Thomas and Carl Palechek—described their experiences with personal computers. The program was rounded out by a laboratory session which involved writing and executing several short machine-language programs.

In general, our participants found the workshop interesting

NEW Now Featured On Display!

Apple II™

the personal computer.

Simplicity . . . the Ultimate Sophistication.

- Smaller
- Games with Paddles & Sound
- Faster
- Color Graphics
- Easier to Use
- Ruggedly Engineered
- More Powerful
- Unbreakable Plastic Case

Not a Kit! Comes complete, ready to hook up to your Color T.V. and begin writing your own programs the very first evening. Apple II uses BASIC, the English-like programming language and has a familiar typewriter-like keyboard. Built to withstand child usage.

Apple II is a complete, self-contained, ready to use computer. Standard features include BASIC and Monitor in ROM (8K bytes), Color Graphics, up to 48K bytes RAM (4K included), cassette interface, Apple GAME I/O connector, typewriter-style ASCII keyboard, high-efficiency switching power supply and plastic molded case. Also included as standard are: 1 demonstration cassette tape, two game paddle controllers and detailed operations manual.

Come in and try it for yourself. You'll love it!

but had some reservations. Our real problem was that the EPA Micro-68 computers were not the type that would be useful at the elementary or secondary levels. These computers are really intended as digital trainers or prototyping systems for engineering applications. Several teachers suggested that they were interested in complete systems with adequate peripherals that could be programmed in a high-level language (preferably BASIC).

Furthermore, we had to show the teachers that personal computers could be a useful classroom tool. Several teachers said they needed to see things that they could use immediately, rather than just hear suggestions. We had to sit down and really think about how to sell teachers on utilizing computers.

The participants generally did not want to assemble kits, attach peripherals or maintain their own computers. They had neither the facilities nor the time for that approach. The only attraction of kits was that they could be purchased as instructional supplies rather than as capital equipment. Most school districts (like many companies and government agencies) have elaborate procedures for purchasing computers. Although these procedures make little sense now that computers are so inexpensive, they will remain an obstacle to computer purchases for many years.

Some Further Efforts

Since that first effort, we have held two more workshops. We now have cooperation from Computer Power and Light, a manufacturer of complete microcomputer systems that include a keyboard, monitor and audio cassettes (see Photo 4). These systems come assembled, and can be programmed in BASIC. The manufacturer provides local maintenance and some software. We are now trying to emphasize the use of computers to aid in remedial education (they have infinite patience), to provide simulated

experience and to help teachers perform routine tasks.

The problem of reaching our potential audience remains a serious one. Clearly a small volunteer group cannot put a massive, continuous effort into publicity, personal contacts and telephone reminders. We are now trying to work through the San Diego County Department of Education and we're hoping the department can handle the difficult task of reaching that audience.

Overall, I think this experience has been useful, even though it is little more than a beginning. In fact, I may have learned more than the teachers since I have become acquainted with school administrations, financing methods, district policies and school problems. I have had an opportunity to see Bob Albrecht in action (he's fabulous), and to meet a large number of concerned educators.

Some Suggestions

Teacher education presents a real opportunity for local computer clubs and enthusiasts. I suggest the following guidelines.

1. Work through your local school district or county department of education. Otherwise the problem of publicity is enormous.
2. Explain computers from the beginning. Don't assume teachers have any background, particularly familiarity with the personal-computer movement. Remember that S-100 bus, Altair, Imsai, floppy disk, RAM, ROM and other such terms are not common knowledge.
3. Emphasize how teachers can use computers to help with everyday classroom tasks. Try to bring in local teachers who have actual experience with small computers.
4. Don't hesitate to include some games and other attention-grabbers—teachers are almost human, after all. Include some useful programs as well.
5. Include some organized hands-on experience, preferably involving programming low-cost computers in BASIC.

☆ 4 SIMULTANEOUS OUTPUTS AVAILABLE: THE ONLY ONE ON THE MARKET

 - ☆ LOW PROFILE CASE (OPTIONAL) \$40.00

Actual experience is the only way to overcome the fear of computers so many people feel.

6. Discuss sources of additional information and equipment. These sources include computer clubs, stores and magazines. *Calculators/Computers* magazine is a new journal that deals specifically with educational applications. (I will gladly provide a list of selected books and magazines.)

7. Emphasize complete systems that do not require a high level of expertise to build, use or maintain. Explain some of the pitfalls, but don't make the road seem too hard to travel.

8. Be sure to note that we

don't have all the answers yet. The entire personal-computer business is only a few years old, and most of the exciting developments are still ahead of us.

9. Try to get actual systems into schools, even if just for an afternoon. In-school demonstrations help create publicity and encourage students and teachers.

Acknowledgements

I am glad to be able to thank the following people for their invaluable assistance:

Dr. Russ Cassel, whose energy and enthusiasm should be a guide for all of us.

Dr. Melvin Zeddies, a first-

class speaker and educator.

Dr. Jane Gawronski of the San Diego County Department of Education.

Dr. David Lien, Mr. Leslie Phillips and Ms. Margie McMur-ray of Grossmont College.

Mr. Victor Wintriss and Ms. Patti Neumann of Electronic Product Associates.

Mr. Michael Scholnick, Ms. Dianne Simpson and Mr. Ian Law of Computer Power and Light.

Mr. Wirt Atmar of Ai Cybernetic Systems, for providing a cassette describing Cybernetic's speech synthesizer.

Also—Carl Palechek, Ed Nagy, Gary Mitchell, Laura Thomas, Irv Stafford, Peter Young, Robert King, Lewis

Freed, and many others. John Craig of *Kilobaud* has been a constant source of encouragement. ■

In-Circuit IC Tester

- Allows simple, fast, inexpensive in-circuit testing of most 7400 series ICs, using the well known XOR technique.
- Can monitor an IC for hours and detect an error occurring only once!
- Draws its current (typically 150 mA) from the power supply of the IC under test.
- A known good IC of the same type* is inserted into the socket on the tester, the two eight pos. DIP switches are set as required, and the test clip is placed on the IC to be tested. The tester then monitors all data lines until an error is found.
- Can test any DIP IC meeting the following requirements:
 - + If IC is storage type (latch, counter, etc.) reset or load must be active. (i.e. IC under test and known good IC must start at same state)
 - + If 16 pin: Vcc on pin 16, Gnd on pin 8
 - + If 14 pin: Vcc on pin 14, Gnd on pin 7

MODEL IC77 Kit price \$32 includes all parts, printed circuit board and pre-wired test clip. *not incl.

"PIXE-PLEXER"

Ends those SPECIAL Video Monitor PROBLEMS!

MODEL
PXP-4500

\$24.50
kit

Pixe-Plexer is an IC type modulator-RF oscillator for interfacing audio, color and regular monochrome video signals from computers, TV cameras, VTR's, games, etc., for display on any regular TV set via the antenna terminals. Power requirements: 15V @ 50 ma max. Operates on ch. 2-6 tunable. Includes 3.58 Mhz color subcarrier and 4.5 Mhz audio subcarrier with varactor modulator. R-Y and B-Y inputs. Analog or digital inputs. Complete with IC data sheet and instructions. Numerous circuit variations from deluxe to simple.

For all other video display needs, don't forget our popular "Pixe-Verter" Mod. RF kit. Model PXPV-2A. \$8.50.

Available from your local dealer or factory-direct. Phone or write for additional assistance. Dial 402-987-3771.

PUBLISHER'S REMARKS

(from page 7)

the case: "... the plastic is not strong enough to keep the fasteners in place. After I opened the top a few times both fasteners broke loose." He also found trouble with the cover uprooting the keyboard when he removed it. He particularly had trouble with the color TV monitor and discussed that at great length... including a severe problem he had with radio frequency hash from the computer. He stressed this a couple of times and then went on to gripe that there were no peripherals available for the Apple bus.

He didn't like the game paddles supplied, so a great deal of the article was devoted to his making his own joystick, an engineering triumph of which he seemed extraordinarily proud. He left me with the strong impression that before I could do much with the Apple I would have to duplicate his chore of buying all the parts and building my own joystick. I would then have to dig into the Apple and wire my new control

Byte editor Helmers.

system directly into the computer before I could use it. This would obviously ruin the portability of the unit and I doubt if I could get the bottom cover back on. Phooey.

Helmers didn't like the BASIC supplied. "But the 5K BASIC, even given its string capabilities, is not what one would want to use... The people at Apple have hacked the (BASIC) interpreter... had to sacrifice two statements: LET and REM." This in order to have graphics. He beefed about the lack of the high-resolution software package...

called the applications software "a mixed bag"... didn't like the loose-leaf documentation and the lack of tutorial on how the computer works... and found the documentation "scanty" on the BASIC interpreter.

Absent from the review was any objectivity or discussion of the benefits of the system to the beginning computerist. He said nothing about where one could get applications software for the system... how easy it is to use and to learn... how many people are able to sit down and learn

the fundamentals of microcomputing in a few hours with the Apple, etc. Obviously he had no interest in the tremendous enthusiasm of the Apple owners... any one of whom could have done a far superior job of reviewing the system.

Computer Portraits: Up and Coming

Most of use have run into

Apple controller.

NORTH STAR

DISK ASSEMBLER and DISK EDITOR

Both programs read and write disk files; file size not limited by memory. Assembler will assemble up to ten source files at a time; permits modular programming with programs easily relocated by reassembling at the desired address. Editor does not use line numbers; it searches for strings. Lines may be inserted, deleted and displayed. Large disk source files allow programs to be fully commented.

See us at the NCC Personal Computing Fair, June 5-8, 1978, in Anaheim, Calif.

computer-portrait outfits at shows, shopping centers, fairs, vacation spots, etc. It turns out, according to a release from Centronics (which we'll be publishing) that there are fortunes to be made with these systems.

One of the exhibits at the San Jose show was a portrait system by Micro Works, a new outfit in Del Mar (California, of course). Their price for a complete system was ridiculously low . . . around a quarter that of one of the lowest-priced commercial systems. While the cost of the equipment needed to make \$100,000 in sales (mostly profits) over a six-week period is not relevant if it's under \$50,000 . . . not many locations will produce that amount of dollars . . . so a few bucks saved is a few bucks earned.

Since many computer hobbyists are not totally opposed to making money with their systems, we'd like to have some articles on commercial applications of microcomputers . . . such as for computer portraits.

First European Microcomputer

The European agents for *Kilobaud* have forwarded informa-

tion on NASCOM 1, a micro-computer kit selling for 980 DM (from an address in Trier, W. Germany). The system uses a Z-80 chip and has its own bus structure, which the literature doesn't divulge. They do have a NASCOM to S-100 bus interface board available, so any of the hundreds of S-100 boards can be used with the system. They also have a Kansas City cassette interface available.

The kit includes a full alphanumeric keyboard and character generator. It requires a TV set for video display and a separate power supply (another 130 DM). It appears to have 4K of memory and includes a small operating system (NASBUG) in ROM and its own cassette system, not com-

patible with any other known system (as usual).

My plans are to be in Europe in May, and I hope to have a fuller report on NASCOM after the May show in Paris. Trier is quite near the Luxembourg border, and is not that far from Paris. It is a beautiful old city, with many Roman ruins . . . such as the remains of extensive outdoor baths, and a coliseum for Roman games. I won't have a chance to get up there to see the NASCOM distributor; however, perhaps I will have a chance to visit the factory in the UK on the way to Paris.

Buying Mail Order

There are several firms that are not permitted to advertise in *Kilobaud* because we have had so many complaints about them. But, outside of checking the ads in *Kilobaud*, how can you protect yourself against rip-offs? Not that an ad in *Kilobaud* is positive proof of anything because we get taken in too . . . and of course there are still some credible advertisers who are not running ads in *Kilobaud* for reasons of their own . . . odd as this may seem.

To get your best shot at not getting a bad deal, I suggest the following procedure. This has to do with firms about which you may have a question . . . not steady advertisers in *Kilobaud* such as S.D. Sales, Godbout, etc. Before you plunk a big bunch of money in an envelope, take some precautions.

1. Write a letter to the firm asking for a confirmation of prices and a definite commitment on delivery within two weeks of your order. Keep a copy of this letter in your files.

2. If they do promise delivery within two weeks, it is time to place your order. If they say no, it is time to hold off until they get their act in shape. If you are going to order, send them a certified check or money order for the amount, or the order and a letter explaining exactly what you are ordering, giving every possible detail. State clearly that shipment is to be made within two weeks or else your check is to be returned. Send this letter by certified mail, with a return receipt. This costs a dollar and may be worth it. If you are not extremely clear in your order it could delay things while the firm writes to find out what baud rate you need, etc. Keep a

couple of copies of the order and check.

3. If you have heard nothing in a month it is time to get into action. Write a letter asking for the return of your money. Send a copy of your order to the firm and point out their promise of delivery within two weeks. Tell them that unless they respond immediately you will take the matter to the mail-order-fraud department of the post office, to your attorney general, and to the Better Business Bureau in his town. Keep a copy of this letter . . . and send me a copy.

4. If you hear nothing further within ten days, it is time to write to the post office, the attorney general, Better Business, and anyone else you can think of who might be interested. By all means, send a copy of the correspondence to me. I don't want to run ads from firms like this . . . and I just might be able to help you get your refund.

Book Manuscripts Wanted

The *Kilobaud* book department has been expanded recently and several books are in the works; more are needed . . . if you are looking for fame and fortune.

A publisher has two major functions, and *Kilobaud* is uniquely suited to both of these. First comes the printing of the book, which can be an expensive proposition. In our case, we edit the manuscript, do the drafting of any schematics, set the type, do needed photography, proof-read the type, lay out the pages, put the type, photos and draftings together on the page, shoot the negatives, make the printing plates, buy the paper, print the book, bind it and ship it. Everything is done right at *Kilobaud*! Few publishers have such a complete setup . . . or one nearly as efficient.

The second function is advertising and distributing the book. Again we have everything, including a magazine to help with the advertising. Our marketing staff prepares promotions for computer stores, bookstores, radio stores, etc. Our sales staff is in touch with all possible book outlets. With over a dozen books now being distributed, we know the market well.

What kind of books are needed? Microcomputer-fundamental books are still selling well, despite the large number of them out there. Books of programs for

microcomputer-users are exceedingly popular. Books on programming sell well. Heck, almost any book on computing sells. What are you waiting for? Wouldn't you like to see your name on a book cover?

If you have a book in the works you can do worse than get in touch with our book department and see if you have something viable. It sure is nice when those royalty checks come in.

Good News and Bad News

Perhaps you've noticed that prices on everything have been inching up. As long as we are all so enthusiastic about supporting an ever-growing government, one that has a strong vested interest in spending, not saving, inflation is going to be a fact of life. You've probably read about the recent postal hike and you may know about the next one that's coming. I sense that something has changed in postal rates for maga-

zines when I have to pay 72¢ a copy to mail an issue of *Kilobaud* and remember when I paid 5¢ each to mail *73 Magazine*.

The excuses include more than postage. Paper has doubled in price in recent months, with the grades of paper we used to use being phased out and forcing us to use what the paper mills are making . . . paper so thin it is getting difficult to turn a page without skipping one or two and hardly noticing it. Printers, needing bigger Rolls Royces and yachts, have upped their take . . . and so it goes.

The bottom line is an increase in *Kilobaud's* one-year subscription to \$18. Since about half of our subscribers opt for a three-year subscription for \$36, and we are not increasing this price, the net to us will be about 11 percent. This will put us back where we were when *Kilobaud* started.

With a very high percentage of the renewals coming through for three years, it will be the newcomers to the magazine who will foot the inflation on the one-year rate.

EDITOR'S REMARKS

(from page 7)

or give me a call for reservations and booth costs.

John Craig, RFD Box 100 D, Lompoc CA 93436, (805) 735-1023.

Article Submission

Hey, if you're going to write an article *don't* send it to more than one magazine at a time, OK? That isn't the way the game is played. I don't think any of us likes to be put in a position of "bidding" on a piece of material (and I won't), but even worse than that are the possible messes that can occur.

My most recent experience involving dual submissions resulted

from a record-keeping error on the author's part. It turned out he had submitted the article to another magazine, forgot about it and then sent it to *Kilobaud*. It initially blew my mind when I saw an article that I'd already bought in print . . . in another magazine.

We finally got things straightened out; but to paraphrase an oft-heard democratic dictum: "One article, one magazine."

NEW PRODUCTS

(from page 17)

age differential of bus signals that are asserted "high."

The Extensys device provides glitch-free signals (no spikes interference, crosstalk) by bringing some well-documented analog techniques from transmission-line analysis to the digital world of S-100 computers.

The "Glitch Grabber," which easily plugs into any open slot on the S-100 bus, features a proprietary self-regulating transistor network that controls voltages and modifies circuitry to handle less or more voltage; the circuitry is activated, however, only when the glitch is there, so it does not load the S-100 bus signals.

The "Glitch Grabber" is also very effective when used in business applications where reliable operations are of prime concern.

Extensys, 380 Bernardo Ave., Mountain View CA 94040.

PET-488 Cable Assembly

The Pickles and Trout PET-488 cable assembly makes your PET computer plug compatible with any IEEE-488 device. The PET computer can become the controller for a wide variety of electronic test equipment and computer peripherals. You can use your PET as the basis for an automated testing system or you can take advantage of the numerous peripheral devices (more appear every month) that can talk to the IEEE-488 bus.

The PET-488 cable assembly plugs directly into the edge connector on the back of the PET computer and has a completely 488 compatible connector on the other end. The cable itself meets all IEEE-488 specifications for

shielding and crosstalk and is 18 inches (.45m) long. Price is \$30 (California residents, please add 6 percent sales tax).

Pickles and Trout, PO Box 1206, Goleta CA 93017.

Professional Software

The Comprehensive Mailing List Program Package, #ML-INS, is a modular program set which enables the user to start and effectively maintain one or more mailing lists. Operations include: Add, Delete, Search, Sort, Auto-Sort and Sequential Print-out. Features include: user-selectable defaults for ease of entry, user-selectable number of labels across page for different printers and label sheets and user-selectable 3- or 4-line address for each independent entry. The program set is written for convenience and ease of use. Available with complete documentation and North Star diskette for only \$25 ppd.

Delivery is from stock. Documentation package only is \$4.50 ppd, fully refundable with order for diskette. Order from: Williams Radio and TV, Inc., Computer Division, 2062 Liberty St., PO Box 3314, Jacksonville FL 32206.

BOOKS BOOKS

(from page 12)

impression of two guys talking to each other. The result is a very readable pair of books that are also extremely informative.

The books aren't flawless, of course. The most irritating things are the typographical errors. Fortunately, only a couple of them are likely to cause you any confusion while reading. An errata sheet will be available soon. Sorry, but even though I tried, I couldn't come up with anything else bad to say.

In short, these books are ideal for someone who is just getting into home computing. Even for the more experienced reader, they tie up a lot of the loose ends and show the relationships among things that may not have been clear before.

NOW A SOLUTION TO YOUR I/O HEADACHE #33

The OE 1000 Terminal is a low cost stand alone video terminal that operates quietly and maintenance free. It will allow you to display on a monitor or modified T.V. 16 lines of 64 characters. The characters can be any of the 96 ASCII alphanumeric, and any of the 32 special characters. In addition to upper-lower case capability it has a scroll up feature and full X-Y cursor control. All that is required from your microcomputer is 300 baud, RS 232 or 20 mA current loop, serial data. And if that is not enough the price is only \$275.00 in kit or \$350.00 assembled, plus \$3.00 shipping and handling. To order phone or write:

Kilobaud Classified

Kilobaud classified advertisements are intended for use by those individuals desiring to buy, sell, or trade used computer equipment or software. No commercial ads are accepted.

Two sizes of ads are available. The \$5 box allows five lines of about 22 characters each, including spaces and punctuation. The \$10 box provides ten lines of type — again, each line is about 22 characters. Minimize capital letters, as they use twice the space of small characters. Payment is required in advance with ad copy. We cannot bill, or accept credit. Oversize ads are not accepted. Each subscriber is limited to two (2) identical ads in any given issue.

Advertising text and payment must reach us 60 days in advance of publication. For example, advertising copy for the March issue (mailed in February) must be in our hands on January 1. The publisher reserves the right to refuse a questionable or not applicable advertisement. Mail advertisements to: KILOBAUD CLASSIFIED, Kilobaud, Peterborough, NH 03458. Do not include any other material with your ad, as it may be delayed.

PET owners—train your new PET with this software: try Dictator at \$10 or King at \$7.50, or a tape of 10 games at \$20. Send SASE for complete list. Guaranteed. Dr. Daley, 425 Grove Ave., Berrien Springs MI 49103.

CORRECTIONS

Robert L. Smith of 2300 St. Francis Dr., Palo Alto CA 94303, writes:

"I have some information that may be of use to readers of the article, 'Super Terminal!' (March issue, p. 48), about the Burroughs/Friden 9350-2. There were some unidentified pins on Table 4 (and at least one pin in error). The identification should be as follows:

Pin No.	Function
24	SHIFT ENCODER #1
26	SHIFT ENCODER #2
27	BIT 6 OUT
28	PARITY BIT OUT
32	CONTROL BIT 6 OUT
33	CONTROL BIT 5 OUT
34	CONTROL PARITY BIT OUT
37	CONTROL BIT 7 OUT

Note that in Fig. 6, the missing pin is pin 27.

"It is not impossible to repair and modify the original boards, as I have done so, even before I obtained any original documentation. I did, however, have to generate a fair amount of documentation on my own.

"At least some of the ICs on the original circuit boards are apparently available from Raytheon. I have a limited supply of the various ICs (unused) if anyone is in need of them. I also have some used circuit boards and a fair amount of mechanical and electrical documentation for the 9350. However, I do not have any decent method for copying and distributing most of the documentation because of the large volume of the material."

Chris Kilgus of Phoenix AZ wrote to inform us that the ACIA in Fig. 1 of Don Gille's article "Tuned for Speed" (February issue, p. 59) is an MC 6850 rather than a 6820.

Our address was printed as Box 2485 in the "Mystery Program" in the April 1978 issue. It should be: Tom Rugg and Phil Feldman, PO Box 24815, Los Angeles CA 90024.

STAND ALONE VIDEO TERMINAL

Now, a completely self-contained video terminal card for less than \$150.00. Requires only an ASCII Keyboard and TV set to become a complete interactive terminal for connection to your computers serial IO port. Two units available, common features are: single 5V supply, crystal controlled sync and baud rates (to 9600 baud), computer and keyboard operated cursor control, parity error and control, power on initialization, forward spaces, line feed, rev. line feeds, home, return cursor, and clear to end of line. Power requirements are 5V at 900ma, output std. IV p-p video and serial TTL level data.

Features:	TH3216	TH6416
Display	32 characters by 16 lines 2 pages	64 characters by 16 lines scrolling
Characters	Upper case ASCII	Upper/lower case optional
Baud Rates	300-9600	110-9600
Controls	Read to/from memory	Scroll up or down
Price (kit)	\$149.95	\$189.95

Above prices include all IC sockets

Frequency Counter \$79.95 KIT

You've requested it, and now it's here! The CT-50 Frequency Counter Kit has more features than counters selling for twice the price. Measuring frequency is now as easy as pushing a button, the CT-50 will automatically place the decimal point in all modes, giving you quick, reliable readings. Want to use the CT-50 mobile? No problem, it runs equally as well on 12 VDC as it does on 110 VAC. Want super accuracy? The CT-50 uses the popular TV color burst freq. of 3.579545 MHz for time base. Tap off a color TV with our adapter and get ultra accuracy — .001 ppm! The CT-50 offers professional quality at the unheard of price of \$79.95. Order yours today!

SPECIFICATIONS

Sensitivity: less than 25mV
Frequency range: 5Hz to 60MHz, typically 65MHz
Gate time: 1 second, 1/10 second, with automatic decimal point positioning on both direct and prescale
Display: 8 digit red LED 4" height
Accuracy: 2 ppm, .001 ppm with TV time base
Input: BNC, 1 meg ohm direct, 50 ohm with prescale option
Power: 110 VAC 5 watts or 12 VDC 1/4 amp
Size: Approx. 6" x 4" x 2", high quality aluminum case

PRICES

CT-50, 60MHz Counter Kit	\$79.95
CT-50WT, 60 MHz counter, wired and tested	\$159.95
CT-600, 600 MHz prescaler option for CT-50, add	\$29.95

VIDEO TO RF MODULATOR

Convert any TV set to a video monitor. Super stable circuit is glitch-free, tunable over channels 4-6. Runs on 5-15V. Recommended by many computer manufacturers. Std. video input. Complete kit, VD-1 \$6.95

ECONO-KITS... 19 WAYS TO START YOUR OWN ELECTRONIC INVENTORIES

P32

ECONO-KITS provide you, the hobbyist or technician, with the most popular components in today's home market. These kits save you time and money because most of your components are at arms reach. Each kit is packaged in a clear plastic box for easy storage (PK-9 is polybagged) and portability. ECONO-KITS contain high-quality components with a comprehensive cross section of the most popular values and styles.

You'll find ECONO-KITS to be the best value on the market today. Choose from any of the 19 kits listed below or buy the whole series. Start building your own inventory today. To order your kits, call us at (516) 582-6256 or send your order in by mail (\$25.00 minimum order, please).

Part No.—PK-7 Cost—\$2.75</p> <p>8 TRIMMER POTENTIOMETERS
15 Piece assortment of popular values from 200 Ohm thru 2.2 Meg, vertical and horizontal mount
Part No.—PK-8 Cost—\$3.50</p> <p>9 DIPPED TANTALUM CAPACITORS
15 most commonly used values
1 MFD thru 100 MFD; 6.3 Volt thru 25 Volt, 15 pieces total
Part No.—PK-9 Cost—\$4.50</p> <p>10 POWER RESISTORS—3 WATT
24 pieces of standard ohmic values from 47 ohm thru 2.2K
Part No.—PK-10 Cost—\$5.75</p> <p>11 POWER RESISTORS—5 WATT
24 Pieces of standard ohmic values from 1 ohm thru 2.2K
Part No.—PK-11 Cost—\$7.50</p> <p>12 POWER RESISTORS—10 WATT
24 Piece assortment of standard ohmic values; 47 thru 10K
Part No.—PK-12 Cost—\$10.50</p> | <p>13 SLIDE AND ROCKER SWITCHES
24 assorted slide and rocker switches in various configurations for a multiple of uses.
Part No.—PK-13 Cost—\$4.50</p> <p>14 HEAT SHRINK TUBING
10 1 ft. lengths of assorted sizes. Sizes starting at 1/8" dia.
Part No.—PK-14 Cost—\$3.50</p> <p>15 RECTIFIER DIODES
21 Pieces total, 3 each from 1N4001 thru 1N4007; 50 PIV thru 1000 PIV 1AMP
Part No.—PK-15 Cost—\$6.50</p> <p>16 I.E.D.'s
6 Assorted led's, 1 each of the TL series plus 5 other popular types.
Part No.—PK-16 Cost—\$5.25</p> <p>17 1 WATT ZENER DIODES
48 Pieces total, 2 each from 1N4728 thru 1N4750
Part No.—PK-17 Cost—\$9.60</p> <p>18 500MW ZENER DIODES
14 Pieces total, 2 each from 1N5226 thru 1N5252
Part No.—PK-18 Cost—\$8.95</p> <p>19 IC SOCKETS
18 Pieces total, 6 Pieces each of 8 Pin, 14 Pin and 16 Pin Low Profile Dual In Line Sockets.
Part No.—PK-19 Cost—\$6.00</p> |

PRIME COMPONENTS CORP./65 ENGINEERS RD./HAUPPAUGE, NEW YORK 11787/TEL. 516-582-6258

THE SSB \$150 FLOPPY DISCOUNT

Affordable

The tribe at Smoke Signal Broadcasting took our BFD-68 disk system and scalped the price, but not the features to create the ABFD 68 (Affordable Basic Floppy Disk). We appreciate the fact that the computer hobbyist gave us our start and we haven't forgotten you.

\$649 Assembled

Compare Price. Our SS-50 bus compatible disk system is \$150 less than the assembled price of the leading S-100 disk system. And you can at least double that savings when you buy one of the computers manufactured by MSI or SWTPC that use the superior 6800 microprocessor.

Programmable

The BFD-68 is well known for its fine software. The system comes with the best disk operating system available and we offer a multitude of other compatible software products. These include a BASIC interpreter with disk file handling capability. By the way, our DOS now easily handles true random access files as well as sequential. Also, we have a super fast BASIC compiler for business applications. In addition, a Text Editor, 2 Assemblers, a Trace Disassembler useful for program debugging and an Object to Source Code Generator are all stock items available for immediate delivery. A word processor will be available very soon.

Reliable

We delivered our first mini-floppy disk system a year ago — 6 months ahead of any other 6800 based mini system. Thus, we've had twice the experience in building reliability into the system. Our NEW disk controller was designed using all we have learned in the past year about system reliability.

The ABFD-68 contains all the built in reliability of our regular BFD-68 plus you save money by supplying your own cabinet and power supply for the disk.

Available

We've shipped literally tons of our BFD-68 disk system in the past year and have learned to keep our production up with demand. Give us a call and chances are we'll be able to ship you the new ABFD-68 from stock and charge it to your Master Charge or Visa card. Better yet, ask us for the name of the computer store nearest you that carries our complete line of computer products.

Don Lancaster's ingenious design provides software controllable options including:

- Scrolling • Full performance cursor
- Over 2K on-screen characters with only 3MHz bandwidth
- Variety of line/character formats including 16/32, 16/64 even 32/64
- User selectable line lengths

SELECTRA-TERM™

Formerly SELECTERM

The Best SELECTRIC II* Printer Going for ANY Computer!

SELECTRA-TERM is a brand new IBM Selectric II* typewriter which has been fully converted for direct connection to your computer. A special typing element gives you full ASCII and upper/lower case alphanumerics. You also have backspace, tab, index and bell—all under computer control.

SELECTRA-TERM can also be used as a standard typewriter. It has been approved for computer use and comes with the IBM warranty. You may also obtain the yearly service agreement for the typewriter portion. MCD provides *Reg. trademark of IBM Corp.

their own factory warranty on the electronics conversion.

Complete electronics package, cable sets and documentation are supplied. Price is \$1750 with many options. Ask your dealer for details or contact:

MINIATURE SOLID STATE

202 VIDEO CAMERA KIT

FEATURING A... 100 x 100 BIT SELF SCANNING CHARGED COUPLED DEVICE

THIS UNIQUE UPDATED CAMERA KIT
FEATURES THE FAIRCHILD CCD 202C IMAGE SENSOR

\$5

FEATURES

- Sensitive to infra red as well as visible light
- May be used in a vacuum, under water and high altitude
- May be used in a magnetic environment because there is no high voltage
- All components mounted on parallel 3 3/4" x 6 1/2" single sided boards
- Total weight under 1 lb.

ADVANTAGES

- **IN THE FUTURE WE WILL SUPPLY A COMPUTER VIDEO INTERFACE CARD**
- All clock voltages operate at 6V requiring no adjustments
- Higher video output signal
- We supply the power board, so only a 5V 1 Amp power source is needed
- The circuitry has been simplified for easier assembly
- Two level TTL output is supplied for interfacing

\$349.00 KIT

Add \$75.00 to assemble and test

We supply all semiconductors, boards, data sheets, diagrams, resistors, capacitors, and 8MM lens.

Sorry we do not supply the case, batteries and 5V supply.

Add \$2.00 Postage and Handling

ATTN: FUTURE COMPUTER BUYER

WE ARE PROUD TO INTRODUCE A CONCEPT IN SMALL SYSTEMS COMPUTING WHOSE TIME HAS COME: "THE COMPUTER WAREHOUSE".

"THE COMPUTER WAREHOUSE" PROVIDES A NEW MORE ECONOMICAL WAY TO BUY A TURN-KEY COMPUTER SYSTEM. SPECIFICALLY,

- ◆ WE HAVE ASSEMBLED A VARIETY OF COMPETITELY PRICED SYSTEMS STARTING AT UNDER \$1000.00 .
- ◆ EACH SYSTEM IS EXTENSIVELY PRE-TESTED FOR BOTH HARDWARE AND SOFTWARE COMPATIBILITY.
- ◆ EACH SYSTEM IS SHIPPED DIRECT FROM "COMPUTER WAREHOUSE" STOCK TO AVOID UNNECESSARY DELAYS.
- ◆ EACH SYSTEM IS DESIGNED TO BE UPWARD EXPANDABLE AS ADDITIONAL CAPABILITY IS NEEDED.

TO HAVE YOUR OWN COPY OF OUR FIRST "COMPUTER WAREHOUSE CATALOG" SEND \$1.00, YOUR NAME, AND A MAILING ADDRESS. YOUR CATALOG WILL ARRIVE WITHIN 3 TO 4 WEEKS, DEPENDING ON MAIL HANDLING. IF YOU WANT TO MOVE MORE QUICKLY, CALL 800-227-3035 (SALES ONLY). IN CALIFORNIA CALL 415-431-0640. WE LOOK FORWARD TO YOUR ORDER.

UART & BAUD RATE GENERATOR *

Part no. 101

- Converts serial to parallel and parallel to serial
- Low cost on board baud rate generator
- Baud rates: 110, 150, 300, 600, 1200, and 2400
- Low power drain +5 volts and -12 volts required
- TTL compatible
- All characters contain a start bit, 5 to 8 data bits, 1 or 2 stop bits, and either odd or even parity.
- All connections go to a 44 pin gold plated edge connector
- Board only \$12.00; with parts \$35.00

8K STATIC RAM

Part no. 300

- 8K Altair bus memory
- Uses 2102 Static memory chips
- Memory protect
- Gold contacts
- Wait states
- On board regulator
- S-100 bus compatible
- Vector input option
- TRI state buffered
- Board only \$22.50; with parts \$160.00

RS-232/TTL INTERFACE *

Part no. 232

- Converts TTL to RS-232, and converts RS-232 to TTL
- Two separate circuits
- Requires -12 and +12 volts
- All connections go to a 10 pin gold plated edge connector
- Board only \$4.50; with parts \$7.00

DC POWER SUPPLY *

Part no. 6085

- Board supplies a regulated +5 volts at 3 amps., +12, -12, and -5 volts at 1 amp.
- Power required is 8 volts AC at 3 amps., and 24 volts AC C.T. at 1.5 amps.
- Board only \$12.50; with parts \$42.50 excluding transformers

TIDMA *

Part no. 112

- Tape Interface Direct Memory Access
- Record and play programs without bootstrap loader (no prom) has FSK encoder/decoder for direct connections to low cost recorder at 1200 baud rate, and direct connections for inputs and outputs to a digital recorder at any baud rate.
- S-100 bus compatible
- Board only \$35.00; with parts \$110.00

Part no. 111

TAPE INTERFACE *

- Play and record Kansas City Standard tapes
- Converts a low cost tape recorder to a digital recorder
- Works up to 1200 baud
- Digital in and out are TTL-serial
- Output of board connects to mic. in of recorder
- Earphone of recorder connects to input on board
- Requires +5 volts, low power drain
- Board \$7.60; with parts \$27.50
- No coils

Part no. 107

RF MODULATOR *

- Converts video to AM modulated RF, Channels 2 or 3
- Power required is 12 volts AC C.T., or +5 volts DC
- Board \$7.60; with parts \$13.50

Apple II Serial I/O Interface *

Part No. 2

- Baud rates up to 30,000
- Plugs into Apple Peripheral connector
- Low-current drain
- RS-232 Input and Output
- Input and Output routine from monitor or BASIC to teletype or other serial printer.
- Program for using an Apple II for a video or an intelligent terminal. Board only - \$15.00; with parts - \$42.00; assembled and tested - \$62.00.

RS-232/TTY * INTERFACE **NEW**

Part no. 600

- Converts RS-232 to 20mA current loop, and 20mA current loop to RS-232
- Two separate circuits
- Requires +12 and -12 volts
- Board only \$4.50, with parts \$7.00

TELEVISION TYPEWRITER

Part no. 106

- Stand alone TVT
- 32 char/line, 16 lines, modifications for 64 char/line included
- Parallel ASCII (TTL) input
- Video output
- 1K on board memory
- Output for computer controlled cursor
- Auto scroll
- Non-destructive cursor
- Cursor inputs: up, down, left, right, home, EOL, EOS
- Scroll up, down
- Requires +5 volts at 1.5 amps, and -12 volts at 30 mA
- All 7400, TTL chips
- Char. gen. 2513
- Upper case only
- Board only \$39.00; with parts \$145.00

MODEM *

Part no. 109

- Type 103
- Full or half duplex
- Works up to 300 baud
- Originate or Answer
- No coils, only low cost components
- TTL input and output-serial
- Connect 8 ohm speaker and crystal mic. directly to board
- Uses XR FSK demodulator
- Requires +5 volts
- Board \$7.60; with parts \$27.50

To Order:

E21

Mention part number and description. For parts kits add "A" to part number. Shipping paid for orders accompanied by check, money order, or Master Charge, BankAmericard, or VISA number, expiration date and signature. Shipping charges added to C.O.D. orders. California residents add 6.5% for tax. Parts kits include sockets for all ICs, components, and circuit board. Documentation is included with all products. Dealer inquiries invited. 24 Hour Order Line: (408) 374-5984. * Designed by John Bell.

ADVANCED COMPUTER PRODUCTS

A39

THE FIRST TO OFFER PRIME PRODUCTS TO THE HOBBYIST AT FAIR PRICES NOW LOWERS PRICES EVEN FURTHER!

- 1. Proven Quality** Factory tested products only, no re-tests or fallouts. Guaranteed money back. We stand behind our products.
- 2. Same Day Shipment** All prepaid orders with cashiers check, money order or charge card will be shipped same day as received.

S100 PRODUCTS

LOGOS 16K STATIC RAM

- ★ Low Power
- ★ Selectable Memory Protect
- ★ Totally Buffered
- ★ Phantom
- ★ Battery Back-up
- ★ Address on 1K boundary
- ★ Requires no front panel
- ★ No wait states

ASSEMBLED & TESTED

250ns. 199.95

KIT

250ns. 149.95
450ns. 129.95

Bare PC Board w/Data \$21.95
Now over 1 year successful field experience
Special Offer Buy (4) 8K 450ns. Kits \$117.00 ea.

IMS 16K STATIC RAM

- ★ Memory mapping
- ★ Phantom
- ★ Address 16K Bound
- ★ Use with or w/o front panel
- ★ Power 2.1 amps typ.
- ★ Uses 2114

ASSEMBLED & TESTED ONLY
450ns. \$439.95 250ns. \$495.95

S-100 32K STATIC RAM

- ★ Address 32K Boundary
- ★ Power 450ns. 2.8 amps typ.
- ★ No wait states on 2MHz
- ★ Fully Buffered
- ★ Phantom can be added
- ★ 2114/TMS4045 or 9135

ASSEMBLED & TESTED KIT
250ns. \$849.00 250ns. \$790.00
450ns. \$799.00 450ns. \$740.00

Z-80/Z-80A CPU BOARD

- ★ On board 2708
 - ★ Power on jump
 - ★ 2708 included (450ns.)
 - ★ completely socketed
- Assembled and tested \$185.00
Kit \$129.95
Bare PC Board \$ 34.95
★ For 4MHz Speed Add \$15.00

TDL COMPATIBLE Z-80 CPU

- ★ Compatible to TDL
 - ★ Can be upgraded software & hardware for 4MHz operation
- Assembled and tested \$199.95
Kit \$139.95
Bare PC Board \$ 34.95

BYTE USER 8K EPROM BOARD

- ★ Power on Jump
 - ★ Reset Jump
- Assembled & Tested 94.95
Kit 64.95
Bare PC Board 21.95
Special Offer: Buy 4 kits only \$59.95 each

8080A CPU BOARD

- S100 compatible with 8 level Vector Interrupt fully socketed.
Assembled & Tested \$149.95
Kit \$ 99.95
Bare PC Board w/data \$ 34.95

TARBELL FLOPPY INTERFACE

- ★ S100 Compatible
 - ★ Uses CPM
 - ★ Jumper Selectable
 - ★ Persci, Shugart, etc
- Assembled and tested \$269.95
Kit \$179.95
Bare PC Board \$ 39.95
NOTE: For CPM Add \$70.00
Documentation Add \$20.00

WMC REAL TIME CLOCK

- ★ S100 Compatible
 - ★ Two interrupts
 - ★ Software programmable
 - ★ 1MHz Crystal Oscillator
- Assembled and tested \$179.95
Kit \$124.95
Bare PC Board w/data \$ 29.95

MICRODESIGN MR-16 2716 EPROM BOARD

- ★ Individual Prom Address
 - ★ Uses Low cost 16K TI EPROMS
 - ★ Optional 1K RAM
 - ★ Phantom-control
- Assembled and Tested 174.95
Kit 99.50

DUAL TRACE 15 MEGAHERTZ

\$395.00

PORTABLE MINISCOPE

**MADE
IN THE
U.S.A.!**

**BATTERY
OPERATED!**

FEATURES

- Dual Trace - 2 channel: separate, chopped or alternate modes.
- 15 megahertz bandwidth.
- External and internal trigger.
- Time Base - 0.1 microseconds to 0.5 Sec/div - 21 settings.
- Battery or line operation.
- Automatic and line sync modes.
- Power consumption less than 15W.
- Vertical Gain - 0.01 to 50 volts/div - 12 settings.
- Weight is only 3 pounds.

From the originator of the Digital Voltmeter, Non-Linear Systems comes the MS-215 Miniscope. It is a fine electronic instrument with a great deal of measuring capability and excellent accuracy. Its design is modern, utilizing the latest in low-powered integrated circuits, and it is packaged into the smallest practical size. The instrument fits into many briefcases and tool boxes with room to spare.

Operating characteristics have been chosen so that the MS-215 will make all of the measurements needed in servicing most electronic equipment. It is field-portable so its use is not restricted to the bench.

SPECIFICATIONS:

Vertical Mode: CH1, CH2, CH1 & CH2 (Chopped) & CH1 & CH2 (Alt.)
The Following Specifications apply to each channel

Y Axis Vertical Input: 10mV/div to 50V in 12 Calibrated ranges, as follows:
x1-10mV/div to 10V/div in four ranges, each continuously variable.
x2-20mV/div to 20mV/div in four ranges, each continuously variable.
x5-50mV/div to 50mV/div in four ranges, each continuously variable.
Accuracy is 3%

Input Impedance: 1M ohm shunted by 50 pF.

Bandwidth: DC/DC to 15 Mhz \pm 6 db (DC to 8 Mhz \pm 3 db). AC, same as DC down to 3Hz.

Rise Time: Approximately 23 nS @ 1 division deflection.

Input Voltage: 250 maximum (DC and Peak AC).

Horizontal Mode: Internal Time Base or External Horizontal, switch selectable. In the XY mode, vertical input is through CH1 and horizontal input is through CH2

Bandwidth: DC to 200 KHz (\pm 3 db).

Coupling: AC, DC or ground, switch selectable. Low frequency point on AC is 3 Hz.

Input Impedance: 1Meg ohm shunted by 50 pF.

Deflection Factor: 10mV/div to 50V/div in 12 calibrated ranges. The ranges can be calibrated with the CH2 gain control

Input Voltage: 250V maximum (DC and Peak AC)

Time Base: 0.1 μ S/div to 0.5 Sec/div in 21' calibrated ranges, as follows:
x1, μ S-0.1 μ S/div to 100 μ S/div. x2, μ S-0.2 μ S/div to 200 μ S/div.
x5, μ S-0.5 μ S/div to 500 μ S/div. x1, mS-0.1 mS/div to 100 mS/div.
x2, mS-0.2 mS/div to 200 mS/div. x5, mS-0.5 mS/div to 500 mS/div.
all in four ranges, each continuously variable. (Range increments ar .1, 1, 10, 100.) With vernier in full clockwise position, calibrated time measurements are possible. Accuracy is 3%.

Triggering Internal: Sweep triggered from internal trigger source (In the dual trace modes, the internal trigger source is CH1).

Automatic: Trigger source is internal calibrator frequency. To be used if there is no other trigger source available to synchronize the sweep.

Line: Trigger is derived from line frequency when using the battery charger.

External: Controls function as for internal triggering (1 Megohm input impedance).

Slope: Selects sync to positive- or negative- going waveform.

Coupling: AC

Sensitivity: Less than 1 div for internal trigger and less than 1 volt for external trigger.

Level: Trigger Level control permits continuous adjustment of trigger point in all modes except Auto.

Internal Calibrator: A square-wave signal of 1 volt p-p \pm 5% is provided. Frequency is approximately 1KHz.

Display Graticule: 4x5 div, each division is 0.25 inch. Viewing area 1.1"Hx1.35"W

CRT: Bluish-white phosphor, medium persistence. CRT uses low power filament for low battery drain. Instant on!

Power On-Board Batteries: Three sealed, rechargeable lead acid "D" Cells

Operating Time: Typically 4 hours.

Charging Time Scope Operating: Will run indefinitely but not reach full charge.

Non-operating: Sixteen hours.

External Power: Battery charger 115 vac (220 vac on request), 50-400Hz, less than 15 watts.

Dimensions: 3.1"Hx6.4"Wx8.0"D.

Weight: Three pounds.

Environment Operating Temperature: 0° to 40°C

Shock and Vibration: Designed to withstand normal shock and vibration encountered in commercial shipping and handling.

Accessories Furnished: Tilt stand, battery charger, 2 input cables, and 3 miniature banana plugs.

Optional: Leather carrying case and probes

Warranty: One year parts and labor. Made in the U.S.A.

MS-215 with Rechargeable Batteries and Charger \$395.00

Leather Carrying Case

The leather case has 2 separate compartments. One to hold the scope, the other to hold the charger, probe, shoulder strap, etc. The case can be worn on the belt, or over the neck.

The snaps used on the case are "one way", thus accidental striking the case against an object will not undo the snaps or let it be pulled off your belt.

41-140 \$30.00

Probes

10 to 1 probe with 10 megohm input.

Probe uses spring hook tip for sure connection. Compensation network located at the connector rather than at the probe, so as to keep size a weight to a minimum.

41-141 \$24.50

Deluxe Combination Probe

Switchable 10to1/1to1 probe with an assortment of probe tips to suit any situation.

41-3495 \$34.95

MS-15 Single Trace version of MS-215

\$289.00

DRESSED ENVELOPE WITH 24¢ POSTAGE.

TIDMA

With this Tape Interface Direct Memory Access board you can record and play programs without a bootstrap loader (no prom). This can be up and running as fast as putting it in the socket. It takes complete control of the S-100 bus and reads or writes directly into the memory without the need for the microprocessor. It has an FSK encoder/decoder for direct connections to a low cost cassette recorder at 1200 baud, and inputs and outputs for direct connections to a digital recorder at any baud rate. This board is S-100 bus compatible.

Board only \$35.00 Part No. 112; with parts \$110.00 Part No. 112A

APPLE II SERIAL I/O INTERFACE

This serial I/O port works up to 30,000 baud. Software included are, an input and output routine from the Apple monitor or basic to a teletype or other serial printer. Also a program for using the Apple II for a video terminal or an intelligent terminal. It plugs into one of the Apple II peripheral connectors. It uses very low current. The input and output are RS-232.

Board only \$15.00 Part No. 2; with parts \$42.00 Part No. 2A. Assembled and tested \$62.00 Part No. 2C.

To Order:

Mention part number and description. For parts kits add "A" to part number. Shipping paid for orders accompanied by check, money order, or Master Charge, BankAmericard, or VISA number, expiration date and signature. Shipping charges added to C.O.D. orders. California residents add 6.5% for tax. Parts kits include sockets for all ICs, components, and circuit board. Documentation is included with all products. Dealer inquiries invited. 24 Hour Order Line: (408) 374-5984. Circuits designed by John Bell.

Thanks to you . .

**Presents The All New VIM-1,6502
Based MICROCOMPUTER SYSTEM By Synertek Systems Corp.**

**The VIM-1 Has Arrived!
Time to Get On-Board!**

Don't become stuck in an old technology.
Master the latest, state-of-the-art
Technology of Microprocessors.

Develop insight into the future trends of
microprocessor technology.

VIM-1 Features Include:

- FULLY-ASSEMBLED AND COMPLETELY INTEGRATED SYSTEM that's ready-to-use.
 - ALL IC'S ARE IN SOCKETS
 - 28 DOUBLE-FUNCTION KEYPAD INCLUDING UP TO 24 "SPECIAL" FUNCTIONS
 - EASY-TO-VIEW 6-DIGIT HEX LED DISPLAY
 - KIM-1* HARDWARE COMPATIBILITY
 - The powerful 6502 8-Bit MICROPROCESSOR whose advanced architectural features have made it one of the largest selling "micros" on the market today.
 - THREE ON-BOARD PROGRAMMABLE INTERVAL TIMERS available to the user.
 - 4K BYTE ROM RESIDENT MONITOR and Operating Programs.
 - Single 5 Volt power supply is all that is required.
 - 1K BYTES OF 2114 STATIC RAM onboard with sockets provided for immediate expansion to 4K bytes onboard, with total memory expansion to 65, 536 bytes
 - USER PROM/ROM: The system is equipped with 3 PROM/ROM expansion sockets for 2316/2332 ROMs or 2716 EPROMs
 - ENHANCED SOFTWARE with simplified user interface
 - STANDARD INTERFACES INCLUDE:
 - Audio Cassette Recorder Interface with Remote Control (Two modes: 135 Baud KIM-1* compatible, Hi-Speed 2400 Baud)
 - Full duplex 20mA Teletype Interface
 - System Expansion Bus Interface
 - TV Controller Board Interface
 - CRT Compatible Interface
 - APPLICATION PORT: 15 Bi-directional TTL lines for user applications with expansion capability for added lines
 - EXPANSION PORT FOR ADD-ON MODULES (51 I/O Lines included in the basic system)
 - SEPARATE POWER SUPPLY connector for easy disconnect of the d-c power
 - AUDIBLE RESPONSE KEYPAD
- VIM-1 Manuals: The well organized documentation package is complete and easy-to-understand
VIM-1 CAN GROW AS YOU GROW. It's the system to BUILD-ON. Expansion features that are soon to be offered:

90 DAY WARRANTY PRICE \$269.00

- TV Interface Card
- BASIC Interpreter
- Resident Assembler/Editor
- Port Expansion Kit
- RAM Expansion Kit

If You Like KIM* You Will Love VIM

VIM-1 PROVIDES YOU WITH ON-BOARD EXPANSION. The printed circuit board includes sockets to add additional ROM, PROM, RAM, or Peripheral Ports when you require them. VIM-1 doesn't require you to build up wire-wrap boards to use these options. VIM-1 option boards are merely plugged into the basic unit to give you the added capability you require. We have maintained KIM* hardware compatibility. Our boards will plug into any KIM* motherboard and card cage.

SUPER SOFTWARE

Synertek has enhanced KIM-1* software as well as hardware. The software has simplified the user interface. The basic VIM-1 system is programmed in machine language. For those users who want to develop in assembly language directly on VIM-1 the optional RESIDENT ASSEMBLER/EDITOR can be purchased and plugged into the ROM/PROM expansion sockets ALREADY PROVIDED.

Similarly, those users wishing to develop in a high level language can purchase VIM-1 BASIC as a nominally priced option. Monitor status is easily accessible, and the monitor gives the keypad user the same full functional capability of the TTY user.

**KIM is a product of MOS Technology.*

Other Software Enhancements Include:

- Write Protect of Selectable Memory Areas
- Decimal Point Prompting on Hex Display
- Break Function to Halt Program
- Programmable/Debug/On-Off (Prog. Single-Capabilities)
- Software Breakpoint Feature

Allow 2 to 4 Weeks for Delivery

Quantity Discounts Available Upon Request.

SPECIAL OFFER: Commercial Duty Power Supply Designed For VIM-1 Fully EXPANDED: Fully Enclosed, Regulated Over Voltage Protection, Fused, Grounded AC Cord, and a FULL TWO YEAR WARRANTY.

PROVIDES: + 5 V.D.C. @ 10 Amps. & ± 12 V.D.C. @ 1 AMP.

PRICE IF PURCHASED SEPARATELY \$150.00

PRICED IF PURCHASED WITH VIM-1 \$ 95.00

.. We're Growing!

**HEAVY DUTY IBM 735 I/O SELECTRIC BASED TERMINAL
MECHANICS COMPLETELY REFURBISHED—
ALL NEW MICROPROCESSOR-BASED ELECTRONICS—
SWITCH SELECTABLE FOR EITHER ASCII OR EBCDIC OPERATION
PRICE: \$895**

WHAT YOU SHOULD KNOW BEFORE BUYING ANY STANDARD IBM SELECTRIC TERMINAL

- Carriage Return time is about 5 times longer than a standard terminal; therefore, you need to transmit up to 12 null or rubout characters after the standard CR/LF characters to allow enough time for the carriage return. This may require you to rewrite your computer's software. There are other characters which have similar problems such as Index, Tab, Backspace and Shift.
- The mechanics of the IBM Selectric limit the printing speed to a maximum of 14.9 characters per second, therefore it cannot run at 150 baud (15 characters/sec.)
- The standard baud rate for a Selectric is 134.5 and therefore cannot interface with a system having only the standard baud rates such as 110 or 150 without modifying or completely replacing the terminal's electronics.
- Some of the IBM Selectric terminals use a unique character ball and are *not* interchangeable with the standard typewriter ball. The balls for these are more expensive, harder to find, and do not have the font selection.
- The IBM Selectric's printer and keyboard are mechanically linked together and therefore, without sophisticated electronics, it cannot interface with a full-duplex system.
- The Selectric produces only 10 standard control codes versus 34 on a standard ASCII terminal.
- There are several IBM Selectric terminals around and *not all* have the heavy duty Selectric mechanism.

WHAT YOU SHOULD KNOW ABOUT THE IBM I/O SELECTRIC TERMINAL THAT WE ARE OFFERING

- TWO operating systems (switch selectable)
 - A. As a standard IBM terminal using EBCDIC Code at 134.5 Baud. So that it can be used with IBM equipment.
 - B. As a Full 7-bit ASCII terminal at 110 Baud. With the following features;
 1. The terminal operates at 10 cps, but prints at 14.9 cps and has a 150 character buffer to compensate for the long carriage return time. Therefore there is no requirement to rewrite your computer's software.
 2. It generates all 34 of the standard ASCII control codes.
 3. Full or Half-duplex operation.
 4. Generation of parity.
 5. Two modes of operation:
 - a. TTY Mode: Transmits only upper-case codes (for alpha characters only) like a standard TTY even if the shift key is not depressed.
 - b. Typewriter Mode: Transmits both upper and lower-case codes, dependent upon the shift key being depressed or not.
- Has both RS-232 and 20 ma. Current Loop interfaces.
- Remote/Local switch, so it can be used as a typewriter or a terminal.
- Uses the standard IBM Selectric character ball.
- Has a 15" carriage for up to 132 characters per line.
- Platen feed.

EXPANDABLE EPROM BOARD

16K OR 32K EPROM \$49.95 W/OUT EPROM
Allows You to Use Either 2708's For 16K of Eprom or 2716's For 32K of Eprom.

KIT FEATURES:

1. All Address Lines & Data Buffered
2. Quality Plated through P.C. Board Including Solder Mask and Silk Screen
3. Selectable Unit States
4. On Board Regulation Provided
5. All Sockets Provided W/Board

WE CAN SUPPLY 450As 2708's AT \$11.95 WHEN PURCHASED WITH BOARD.

4K LOW POWER RAM KIT The Whole Works - \$79.95

Full Buffered - on board regulated - reduced power consumption utilizing low power 21L02-1 500ns RAMS - Sockets provided for all IC's. Quality plated through PC board.

*Add \$10.00 for 250ns RAM operation.

BUY A \$100 COMPATIBLE RAM BOARD TO A MAXIMUM OF 65K MEMORY IN STEPS OF EITHER 8K OR 16K AT YOUR OPTION BY MERELY PURCHASING MORE RAM CHIPS FROM SD COMPUTER PRODUCTS.

THE 64K VERSION USES THE MOSTEK MK4116 RAM AND HAS 16K BOUNDARIES AND PROTECTION & UTILIZES DIP SWITCHES. P. C. BOARD COMES WITH SOCKETS FOR 64K OPERATION

LOOK AT THE FEATURES WE HAVE BUILT INTO THE EXPANDORAM!

- MEMORY ACCESS TIME IS 375 ns
- MEMORY CYCLE TIME IS 500 ns
- POWER REQUIREMENTS ARE:
 - 8 VDC 400 MA DC
 - 18 VDC 400 MA DC
 - 18 VDC 30 MA DC
- ON BOARD INVISIBLE REFRESH
- NO WAIT STATES REQUIRED
- NO CYCLE STEALING NEEDED
- ON BOARD REGULATION
- CONTROL, DATA & ADDRESS INPUTS UTILIZE LOW POWER SCHOTTKY DEVICES
- DESIGNED TO WORK WITH Z-80, 8080, 8085, CPU'S

ADD \$50.00 TO ABOVE PRICES FOR FULLY ASSEMBLED AND TESTED BOARDS

Low Cost Cassette Interface Kit \$19.95

Features: Play and record K.C. Standard 2400/1200 Hz tapes; 300 Baud, TTL I/O Compatible, Phase Lock Loop, Both 22 Pin Connector and 8 Pin Molex Connector. Comes partially assembled. Oscillator and phase lock loop pre-tuned to K.C. Standard. Selector switch sends cassette data or auxiliary input data to microprocessor. LED indicates logic 1 level.

8K LOW POWER RAM \$159.95

FULLY ASSEMBLED AND TESTED. NOT A KIT. Imsal - Altair - S-100 Bus compatible, uses low power state 21L02-500ns fully buffered on board regulated, quality plated through PC board, including solder mask. 8 pos. dip switches for address select.

*Add \$30.00 for 250ns RAM operation

Z-80 CPU BOARD KIT Complete Kit \$139.

CHECK THE ADVANCED FEATURES OF OUR Z-80 CPU BOARD: Expanded set of 158 instructions, 8080A software capability, operation from a single 5VDC power supply; always stops on an M1 state, true sync generated on card (a real plus feature!), dynamic refresh and NMI available, either 2MHZ or 4MHZ operation, quality double sided plated through PC board; parts plus sockets provided for all IC's. *Add \$10. extra for Z-80A chip which allows 4MHZ operation.

NEW FROM S.D. "VERSAFLOPPY"™ KIT THE VERSATILE FLOPPY DISK CONTROLLER ONLY \$149.00

FEATURES: IBM 3740 Soft-Sector Compatible, S-100 BUS Compatible for Z-80 or 8080. Controls up to 4 Drives (single or double sided). Directly controls the following drives:

1. Shugart SA400/450 Mini Floppy
2. Shugart SA800/850 Standard Floppy.
3. PERCSI 70 and 277.
4. MFE 700/750.
5. CDC 9404/9406.

34 Pin Connector for Mini Floppy, 50 Pin Connector for Standard Floppy. Operates with modified CP/M operating system and C-Basic Computer. The new "Versafloppy" from S.D. Computer Products provides complete control for many of the available Floppy Disk Drives, Both Mini and Full Size. FD1771B-1 Single Density Controller Chip. Listings for Control Software are included in price.
FD 1771B-1 CHIP ALONE \$39.95

Z80 STARTER KIT LEARN COMPUTERS FROM THE START! SIMPLE, STEP BY STEP LEARNING, CONSTRUCTION, PROGRAMMING, OPERATION, MEMORIES, INTER- FACING, COMPUTING, AND CONTROLLING WITH AUDIO CASSETTE INTERFACE CAPABILITIES.

Complete Kit includes: Key board and Display; Z80 Central Processing Unit; Instructions; Operation Manual; Learning Guides.

Features: Powerful Z80 CPU with 158 instructions • 1024 Bytes (Expandable to 2048 Bytes ON BOARD) of RAM • 2 Bi-Directional Input/Output Ports with Handshaking • Kansas City Standard Audio Cassette Interface for Program Storage • Hexadecimal Keyboard and Display • Wirewrap area for custom circuitry • S-100 Connector on board for Memory and I/O Expansion • 2716/2758 PROM Programmer • "Z-BUG" Monitor ROM (Including: Memory, Port and Register Examine and Change Commands; Breakpoints; Single Step Capability; Audio Tape Load and Dump; Execute user program Commands).

Many more unique features. The best computer educational kit on the market... the complete computer and educational package for only \$199.00. (Available June 1978).

INTRODUCING THE SBC-100 (The Z-80 Based, S-100 Single Board Computer) \$349.00

FEATURES:

- No Front Panel Needed
- Z-80 CPU (2 or 4 MHZ)
- 1K RAM
- 4 ROM/PROM Sockets for 4K/8K of Memory
- SYNCHRONOUS/ASYNCHRONOUS Serial I/O with RS-232 and Current Loop Interface and Software
- Programmable Baud Rate
- Parallel Input Port
- Parallel Output Port
- 4 Channel Timer/Counter
- 4 Vectored Interrupts

S.D. NOW HAS SOFTWARE FOR IT'S CUSTOMERS

CP/M™ DISK OPERATING SYSTEM . . . \$99.95

CP/M is a powerful disk operating system which has become an industry standard. It is compatible with several disk based FORTRAN and BASICS. This package includes a CP/M diskette (mini or full size) adapted for S.D.'s SBC-100/VERSAFLOPPY EXPANDORAM board set. Complete documentation is included. (CP/M is a registered trademark of Digital Research Corp., Pacific Grove, CA.)

Z-80 DISK BASED ASSEMBLER . . . \$69.95

Runs on ANY CP/M based disk system. Assembles the official Zilog-Mostek Mnemonics. Contains extensive set of pseudo-ops. Available on mini or full size diskette.

VERSAFLOPPY™ CONTROL FIRMWARE . . . \$24.95

Provides control for VERSAFLOPPY and boots up CP/M. This runs on Z-80, 8080 or 8085 based computers. Available in 2708 or 2758 prom.

SD MONITOR . . . \$49.95

Powerful monitor for SBC-100 single board computers. Includes all VERSAFLOPPY control firmware. Comes in 2716 prom. Available in 4-6 weeks.

VERSAFLOPPY DIAGNOSTIC PROGRAM . . . \$24.95

Provides routines which are helpful in checking out a disk based system Available in 2708 or 2758 prom.

600 MHz. FREQUENCY COUNTER ±0.1 PPM TCXO

OPTO-8000.1

This new instrument has taken a giant step in front of the multitude of counters now available. The Opto-8000.1 boasts a combination of features and specifications not found in units costing several times its price. Accuracy of ± 0.1 PPM or better — *Guaranteed* — with a factory-adjusted, sealed TCXO (Temperature Compensated Xtal Oscillator). **Even kits require no adjustment for guaranteed accuracy!** Built-in, selectable-step attenuator, rugged and attractive, black anodized aluminum case (.090" thick aluminum) with tilt bail. 50 Ohm and 1 Megohm inputs, both with amplifier circuits for super sensitivity and both diode/overload protected. Front panel includes "Lead Zero Blanking Control" and a gate period indicator LED. AC and DC power cords with plugs included.

SPECIFICATIONS:

Time Base—TCXO ± 0.1 PPM GUARANTEED!
 Frequency Range—10 Hz to 600 MHz
 Resolution—1 Hz to 60 MHz; 10 Hz to 600 MHz
 Decimal Point—Automatic
 All IC's socketed (kits and factory-wired)
 Display—8 digit LED
 Gate Times—1 second and 1/10 second
 Selectable Input Attenuation—X1, X10, X100
 Input Connectors Type —BNC
 Approximate Size—3" h x 7 1/2" w x 6 1/2" d
 Approximate Weight—2 1/2 pounds
 Cabinet—black anodized aluminum (.090" thickness)
 Input Power—9-15 VDC, 115 VAC 50/60 Hz
 or internal batteries
 OPTO-8000.1 Factory Wired **\$299.95**
 OPTO-8000.1K Kit **\$249.95**

ACCESSORIES:

Battery-Pack Option—Internal Ni-Cad Batteries and charging unit **\$19.95**
 Probes: P-100—DC Probe, may also be used with scope **\$13.95**
 P-101—LO-Pass Probe, very useful at audio frequencies **\$16.95**
 P-102—High Impedance Probe, ideal general purpose usage **\$16.95**

VHF RF Pick-Up Antenna-Rubber Duck w/BNC #Duck-4H **\$12.50**
 Right Angle BNC adapter #RA-BNC **\$ 2.95**

FC-50 — Opto-8000 Conversion Kits:

Owners of FC-50 counters with #PSL-650 Prescaler can use this kit to convert their units to the Opto-8000 style case, including most of the features.

FC-50 — Opto-8000	Kit \$59.95
*FC-50 — Opto-8000F	Factory Update \$99.95

PARATRONICS	
Logic Analyzer Kit Model 100A	\$229.00/kit
Model 10 Kit	\$229.00

• Analyzes any type of digital system
• Checks data rates in excess of 8 million words per second
• Trouble shoot TTL, CMOS, DTL, RTL, Schottky and MOS families
• Displays 16 logic states up to 8 digits wide
• See ones and zeros displayed on your CRT, octal or hexadecimal format
• Tests circuits under actual operating conditions
• Easy to assemble — comes with step-by-step construction manual which includes 80 pages on logic analyzer operation.

(Model 100A Manual - \$4.95)

• Some applications are:
— Troubleshooting microprocessor address, instruction, and data flow
— Examine contents of ROMS
— Tracing operation of control logic
— Checking counter and shift register operation
— Monitoring I/O sequences
— Verifying proper system operations during testing

PARATRONICS TRIGGER EXPANDER - Model 10
Adds 16 additional bits. Provides digital delay and qualification of input clock and 24-bit trigger word. — Connects direct to Model 100A for integrated unit.

Model 10 Kit - \$229.00
Baseplate — \$9.95
Model 10 Manual — \$4.95

BK PRECISION 3 1/2-Digit Portable DMM

- Overload Protected
- 3" high LED Display
- Battery or AC operation
- Auto Zeroing
- 1mv, 1V_A, 0.1 ohm resolution
- Overrange reading
- 10 meg input impedance
- DC Accuracy 1% typical
- Ranges: DC Voltage - 0-1000V/AC Voltage: 0-1000V Freq. Response: 50-400 HZ DC/AC Current: 0-100mA Resistance: 0-10 meg ohm Size: 6.4" x 4.4" x 2"

Model 2800 \$99.95
Comes with test leads, operating manual and spare fuse.

100 Mhz 8-Digit Counter

- 20 Hz-100 Mhz Range
- 5" LED Display
- Crytally-controlled timesbase
- Fully Automatic
- Portable — completely self-contained
- Size — 1.75" x 7.38" x 5.63"

Four power sources, i.e. 5" LED Display batteries, 110 or 220V with charger 12V with auto lighter adapter and external 7.2-10V power supply

MAX-100 \$134.95

Accessories:
AC Adapter BC-28 \$9.00
Rechargeable Batteries BP-26 20.00
Carrying Case LC-28 7.50

ACCESSORIES FOR MAX 100:
Mobile Charger Eliminator use power from car battery Model 100 — CLA \$3.95
Charger/Eliminator use 110 V AC Model 100 — CAI \$9.95

63-Key Unencoded KEYBOARDS Hexadecimal Encoder

This is a 63-key, terminal keyboard newly manufactured by a large computer manufacturer. It is unencoded with SPST keys, unattached to any kind of PC board. A very solid molded plastic 13 x 4" base suits most application.

\$29.95/each

19-key pad includes 1-10 keys, ABCDEF and 2 optional keys and a shift key. **\$10.95/each**

The Incredible "Pennywhistle 103"

\$129.95 Kit Only

The Pennywhistle 103 is capable of recording data to and from audio tape without critical speed requirements for the recorder and it is able to communicate directly with another modem and terminal for telephone "hamming" and communications for the deaf. In addition, it is free of critical adjustments and is built with non-precision, readily available parts.

Transmit Method Asynchronous Serial (return to mark level required between each character).

Receive Channel Frequencies 2025 Hz for space; 2225 Hz for mark.

Transmit Channel Frequencies Switch selectable: Low (normal) = 1070 space, 1270 mark; High = 025 space; 2225 mark.

Receive Sensitivity -46 dbm acoustically coupled.

Transmit Level -15 dbm nominal. Adjustable from -6 dbm to -20 dbm.

Receive Frequency Tolerance Frequency reference automatically adjusts to allow for operation between 1800 Hz and 2400 Hz.

Digital Data Interface EIA RS-232C or 20 mA current loop (receiver is isolated and non-polar).

Power Requirements 120 VAC, single phase, 10 Watts.

Physical All components mount on a single 5" by 9" printed circuit board. All components included.

Requires a VOM, Audio Oscillator, Frequency Counter and/or Oscilloscope to align.

The Original the 3rd Hand

\$9.95 each

• Leaves two hands free for working
• Clamps on edge of bench, table or work bench
• Position board on angle or flat position for soldering clipping
• Sturdy aluminum construction for hobbyist, manufacturer or school rooms

DIGITAL STOPWATCH

- Bright 6 Digit LED Display
- Times to 59 minutes 59 seconds
- Crystal Controlled Time Base
- Three Stopwatches in One Times Single Event — Split & Taylor
- Size 4.5" x 2.15" x .90" (4 1/2 ounces)
- Uses 3 Penrite Cells.

Kit — \$39.95
Assembled — \$49.95
Heavy Duty Carry Case \$5.95

Stop Watch Chip Only (7205) \$19.95

IMC 3 1/2-DIGIT DPM KIT

• New Bipolar Unit
• Auto Zeroing
• 5" LED
• Auto Polarity
• Low Power
• Single IC Unit

Model KB500 DPM Kit \$49.00
Model KB503 5V Power Kit \$17.50

JE700 CLOCK

The JE700 is a low cost digital clock, but is a very high quality unit. The unit features a simulated walnut case with dimensions of 6" x 2 1/2" x 1". It utilizes a MAN72 high brightness readout, and the MMS314 clock chip.

12 or 24 Hour
115 VAC
KIT ONLY \$16.95

JE803 PROBE

The Logic Probe is a unit which is for the most part indispensable in trouble shooting logic families TTL, DTL, RTL, CMOS. It drives the power it needs to operate directly off of the circuit under test, drawing a scant 10 mA max. It uses a MAN3 readout to indicate any of the following states by these symbols (H) - 1 (LOW) - 0 (PULSE) - P. The Probe can detect high frequency pulses to 45 Mhz. It can be used at MOS levels or circuit damage will result.

\$9.95 Per Kit
printed circuit board

T-L 5V 1A Supply

This is a standard TTL power supply using the well known LM309K regulator IC to provide a solid 1 AMP of current at 5 volts. We try to make things easy for you by providing everything you need in one package, including the hardware only.

JE225 \$9.95 Per Kit

TYPESETTING MONITOR

We have acquired an unusual video monitor. It was originally designed for and used in the photo typesetting industry. As the typesetter composed his copy, the copy would appear on the screen. The tube is a flat type about 6½" x 2¼", since only one line of copy was scanned at a time. Most of the tubes have slight burn marks, but are still usable. We have all the circuitry, and will supply the circuitry with each order. We believe most of these units are in working order, since they were taken out of service when the equipment was upgraded. Looks like a good start to make into your own video monitor at giveaway prices. We have them with and without the CR tubes. Sold as is only.

STOCK No. 5603K Typesetter monitor with tube & circuit diagrams \$22.50 ea. 2/\$40.00
 STOCK No. 5604K Typesetter monitor without tube, with circuit diagrams . \$15.00 ea. 2/\$25.00

TV HOCKEY and SOCCER GAME plus VIDEOCUBE

For some time we have been selling our VIDEOCUBE, the TV interface between computers, cameras, etc., and your TV set. We sold them in kit form, and to date we have sold over 3,000. We sold the complete VIDEOCUBE, when available, for \$16.95.

We now have a limited number of Hockey-Soccer Video games, complete with VIDEOCUBE interface, at a new low price of \$18.95; previously sold for \$27.50 in kit form. This gives you two games, at two levels of skill, with LED readouts for scorekeeping. This game sold in Boston department stores for \$79.50.

STOCK No. 5495K Complete VIDEO GAME & VIDEOCUBE \$18.95 ea. 2/\$35.00

WIRE WRAP BOARDS LOADED WITH 7400 SERIES ICs

Since last summer, we have been selling 2 wire wrap boards, Our Stock No. 6558K with approximately 100 sockets, and our Stock No. 6559K with approximately 45 sockets. These have been successful, based on your orders and reorders. We now have the same boards, but with the sockets still containing the original SN7400 series ICs that were used in the computer that these boards were designed for. We checked the value of these ICs, against the lowest price ICs in several Electronics magazine, and found that

at the lowest possible surplus prices, the values of the ICs on the 100 socket board ran to over \$40.00. A sample of some of the chips on the board we looked at are as follows: 74H87, 7486, 74107, 7451, 7400, 7404, 7495, 7493, 7492, 74193, 7489 and many others, to numerous to mention. Also on some boards, are a few linears, and phase locked loops. Not everyone needs every chip, but if you are working at all with TTL, this is a great opportunity to get an inventory of the most useful chips at a ridiculous price. We are selling the 100 socket board with about 100 chips, for \$10.00 more than the board itself, and the 45 socket chip for \$5.00 more than the board itself. We will also include with each board, 2 edge connectors with the 100 socket board, and 1 edge connector with the 45 socket board.

STOCK NO.6558K 75 to 100 socket board \$18.75 ea. 2/35.00
 STOCK NO.6559K 45 to 50 socket board \$11.75 2/22.00
 STOCK NO.6749K 75 to 100 socket wire wrap board with ICs and edge connectors \$28.75 ea. 2/55.00
 STOCK NO.6750K 45 to 50 socket wire wrap board with ICs and edge connector \$16.75 ea. 2/32.00
 STOCK NO.6603K Edge connector for either board \$ 2.00 ea 3/5.00

DATA AQUISITIONS SUBSYSTEM

ADC0817 is a 40 pin CMOS I.C. with an 8-bit analog-to-digital converter, a 16 channel multiplexer and micro processor compatible control logic. Converter features high impedance chopper stabilized comparator, voltage divider with analog switch tree and a successive approximation register. Latched Tri-State outputs for easy u-procession interface. Require only 15 mW of power from single 5V supply. Fast, 100uS conversion time.
 ADC0817.....(40 pin DIP).....\$29.88
 Spec sheets.....\$1.00

LOOKING FOR MEMORY ?

OUR BEST SELLER: ECONORAM II™

S-100 Compatible 8K x 8 in a cost-effective package. Buffering on all lines, 0 wait states with the 8080, low power consumption, configured as two separate 4K blocks for addressing flexibility, handles DMA, memory protect with vector interrupt provision if you try to write into protected memory, fully socketed, gold-flashed edge fingers, solder masked and legended board . . . this is the board that doesn't cut any corners, but cuts the price instead.

(See the 1/77 issue of *Kilobaud* magazine for a product profile that tells just about everything you'd ever want to know about Econoram II . . . or send a self-addressed, stamped envelope to "Kilobaud Article" c/o our address and we'll send you a reprint. But if you really want to be convinced . . . talk to somebody who owns one!)

Kit form: \$135.00 3 kits: \$375.00 Assembled, tested: \$155.00

SUPER MEMORY FOR A SUPER MACHINE: H8 COMPATIBLE ECONORAM VI™

Users of the S-100 buss have found out why our memories are their best value . . . now H8 owners can find out too. This 12K x 8 kit offers the same basic features as our ECONORAM series . . . static design, configuration as two blocks (one 8K and one 4K), switch selected protect, sockets for all ICs, full buffering on address and data lines . . . plus the required hardware and edge connector to mate mechanically with the H8. As a bonus, all sockets and bypass capacitors are pre-soldered to the circuit board so you can start right in on the fun part of building this high-quality memory.

Kit form: \$235.00

NEW! 16K x 8 ECONORAM IV™ KIT

S-100 compatible 16K x 8 memory, with all the same features that have made our Econoram line such a winner . . . including static design, buffering, low power (under 2000 mA), write protect switches, and much more . . . but best of all, Econoram IV actually costs less than dynamic equivalents. You've wanted more memory; and here it is.

COMING SOON: 24K ECONORAM VII™ KIT

Just around the corner for your S-100 buss . . . we think you'll like it. While the price per bit is slightly higher compared to our other memories, you get some nice extras along with the regular Econoram features . . . such as the same current consumption as our 16K board, and some more switches and options. It's static, it's 24K, it's an Econoram . . . watch for it!

SPECIAL!! POPULAR PROCESSOR PRICES

These specials are while-they-last, first come-first served.

PACE 16 bit CPU: \$10.00

8080A prime units: \$5.00 (you've come a long way . . . down!)

8008 (if you have an 8008 system, you should have a couple of spares around): **\$2.50**

SEMI-FREE OFFER:

It's not totally free, because you have to buy something in order to get it. But send us an order for more than \$50, and you get one of our fabulous T-shirts. Specify S, M, L.

TERMS: Please allow up to 5% for shipping; excess refunded. Californians add tax. COD orders accepted with street address for UPS. For VISA®/Mastercharge® orders call our 24 hour order desk at (415) 562-0636. Prices good through cover month of magazine.

FREE FLYER: These are just a few of the items we carry for the computer enthusiast. We also stock a broad line of semiconductors, passive components, and hobbyist items. We will gladly send you a flyer describing our products upon receipt of your name and address.

CPU POWER SUPPLY KIT

Here is an economical power supply for small computer systems or digital bench work. Delivers 5V @ 4A with crowbar overvoltage protection; also gives ±12V @ ½A per side. Adjustable negative bias supply, 5-10V @ 10 mA. All in all, if you need a small power supply, you can't beat the performance or the price. If on the other hand you need a bigger supply . . . we just might have something for you soon.

10 SLOT MOTHERBOARD

Whether implemented as an add-on to existing systems that need more room, or as the nucleus of a stand-alone system, this S-100 compatible motherboard fits the needs of the budget-minded enthusiast. Our price includes all edge connectors, along with active termination circuitry that promotes accurate and reliable data transfer. Lots of bypass caps and extra heavy power line traces contribute to efficient operation. Heavy duty epoxy glass board, with a solder mask for easy soldering.

#CK-015, \$90.00. Kit form only.

18 SLOT MOTHERBOARD

All the same features and advantages of the 10 slot version, including our active termination circuitry. Complete with 18 edge connectors.

#CK-016, \$124.00. Kit form only.

DB-25 RS-232 SUBMINI-D CONNECTORS

Male plug, #CK-1004, \$3.95; female jack, #CK-1005, \$3.95; plastic hood for male connector, #CK-1006, \$0.90.

EDGE CONNECTORS

There are edge connectors, and there are Edge Connectors. These are the kind where the pins don't fall out, thanks to the bifurcated contacts. (We use the same connectors with our motherboards.)

#CK-1001: 100 pin edge connector with gold plated 3 level wrap posts. Mates with Altair/MSAI peripherals. \$5 each or 5/\$22.

#CK-1002: Same as above, but with soldertail pins on 0.25" centers. (Mates with IMSAI motherboard). \$5 each or 5/\$22.

#CK-1003: Same as above, but with soldertail pins on 0.14" centers. (Mates with Altair motherboard). \$6 each or 5/\$27.50.

DEALERS: Our dealer plan is alive and well . . . and making both store owners and customers happy. If you're missing out on this action, get in touch with us and we'll send you our dealer information packet.

IS HARD COPY STORAGE A PROBLEM?

Kilobaud, as thick as it is, is more like a floppy when it comes to standing on the bookshelf. Try the Kilobaud Library Shelf Boxes, ... sturdy corrugated white dirt resistant cardboard boxes which will keep them from flopping around. We have self-sticking labels for the boxes, too, not only for *Kilobaud*, but also for *73 Magazine* ... and for *Personal Computing*, *Radio Electronics*, *Interface Age*, and *Byte*. Ask for whatever stickers you want with your box order. Hams may want our labels for *CQ*, *QST* or *Ham Radio*. They hold a full year of *Kilobaud* ... or *73*. Your magazine library is your prime reference, keep it handy and keep it neat with these strong library shelf boxes ... One box is \$2.00, 2 boxes are \$3.00 and eight boxes are \$10.00. Be sure to specify which labels we should send. Have your credit card handy and call our toll-free order number 800-258-5473, or use the order card in the back of the magazine and mail to:

KILOBAUD LIBRARY SHELF BOXES Peterborough, NH 03458

IT'S EASY AND FUN TO BUILD YOUR OWN TEST EQUIPMENT WITH ICs

IC TEST EQUIPMENT \$4.95*

ICs have greatly simplified even the most sophisticated pieces of test equipment, making them fun to build. You can save thousands of dollars by building your own equipment and have a test lab which would make a university jealous.

A brand new book, *IC TEST EQUIPMENT*, has construction projects for making 37 pieces of test equipment. Square wave generator, pulse generator, timer, audio synthesizer, AFSK generator, sync generator, counters, capacity meter, etc.

Order this book today and get started building your own lab.

Use the order card in the back of the magazine or itemize your order on a separate piece of paper and mail to: KILBAUD BOOK NOOK, Peterborough NH 03458 or phone toll free 800-258-5473

WHO'S BEHIND THE kilobaud™?

**This chap behind the Kilobaud
is the driving force behind
a new microcomputer system
. . . using the 6100.
Does that give it away?
Watch out for the dealer network
he's getting together.**

LAST MONTH'S MYSTERY READER

Last month's "Who's Behind the Kilobaud" was Steven Pereira, president of the Microcomputer Store in Nashua. Nashua now has three-going-on-four computer stores, which is remarkable considering its size. New Hampshire's freedom from a sales tax, which saves substantial dollars on a computer system, is drawing many companies to Nashua. Among the many new factories put in recently were a couple by DEC.

READ IT YOURSELF!

If you are not yet a subscriber to Kilobaud, we need you and you need us. There is a lot of data in Kilobaud that you will want to have on hand . . . the magazine is like a continuing encyclopedia of microcomputing and programs. You never know when you are desperately going to need something from a past issue . . . and you'll want it immediately. The cost per year is not significant . . . \$15 at present for \$24 worth of magazines.

You may have noticed that Kilobaud has more articles than any of the other magazines. If you'll keep track of how long it takes you to read Kilobaud as compared to the other computer magazines, you'll see you are getting a great bargain at \$15 per year.

beginner's introductory

● **THE STORY OF COMPUTERS** by Donald D. Spencer is to computer books what *Dick and Jane* is to novels . . . extremely elementary, gives the non-computerist a fair idea of what the hobbyist is talking about when he speaks computer lingo. Attempts to explain what computers are and can do to a spouse, child or any un-electronics-minded friend. \$4.95.*

● **HOBBY COMPUTERS ARE HERE** If you (or a friend) want to come up to speed on how computers work . . . hardware and software . . . this is an excellent book. It starts with the fundamentals and explains the circuits, the basics of programming, along with a couple of TVT construction projects, ASCII-Baudot, etc. This book has the highest recommendations as a teaching aid for newcomers. \$4.95.*

● **THE NEW HOBBY COMPUTERS!** This book takes it from where "Hobby Computers Are Here" leaves off, with chapters on Large Scale Integration, how to choose a microprocessor chip, an introduction to programming, low cost I/O for a computer, computer arithmetic, checking memory boards, a Baudot monitor/editor system, an audible logic probe for finding those tough problems, a ham's computer, a computer OSO machine . . . and much, much more! \$4.95.*

● **HOME COMPUTERS: 210 Questions & Answers** by Rich Didday. Two books aimed exclusively at the novice computer hobbyist/home computer user. Written in a rather unusual style which has a beginner asking questions which are answered by a person with a substantial background in computers and personal computing. The questions are just the kind beginners come up with . . . and the answers are presented in easy-to-understand terms (usually with a diagram to illustrate the point). Both the hardware and software aspects of home computing are covered from A to Z. An index in both books makes them ideal as reference material for anyone. Volume 1: Hardware — \$7.95*; Volume 2: Software — \$6.95*.

● **MICROCOMPUTER PRIMER** by Mitchell Waite and Michael Pardee. Describes basic computer theory, explains numbering systems, and introduces the reader to the world of programming. Describes the world of microcomputing in "real world" terminology. No better way of getting involved with the exciting new hobby of microcomputing. \$7.95.*

● **MICROPROCESSORS FROM CHIPS TO SYSTEMS** by Rodnay Zaks is a complete and detailed introduction to microprocessors and microcomputer systems. No preliminary knowledge of computers or microprocessors is required to read this book, although a basic engineering knowledge is naturally an advantage. Intended for all wishing to understand the concepts, techniques and components of microprocessors in a short time. \$9.95.*

● **INTRODUCTION TO MICROPROCESSORS** by Charles Rockwell of MICROLOG is an ideal reference for the individual desiring to understand the hardware aspects of microprocessor systems. Describes the hardware details of computer devices in terms the beginner can understand, instead of treating the micro chip as a "black box." General information about hardware systems is provided. Specific systems are not described and programming is only briefly discussed. \$17.50 US and Canada, \$20 elsewhere.*

● **AN INTRODUCTION TO MICROCOMPUTERS, VOLS. 1 AND 2** by Adam Osborne Associates, are references dealing with microcomputer architecture in general and specifically with details about most of the common chips. These books are not software-oriented, but are invaluable for the hobbyist who is into building his own interfaces and processors. Volume 1 is dedicated to general hardware theory related to micros, and Volume 2 discusses the practical details of each micro chip. (Detailed review in Kilobaud #2) Volume 1 — \$7.50*; Volume 2 — \$12.50.*

● **HOME COMPUTERS: A BEGINNERS GLOSSARY AND GUIDE** this book is intended as a quick reference source for beginners. Included is a general introduction to microcomputers, a simple application & sample system, the history of microcomputers & their uses, and an introduction to some actual equipment. A chapter on number systems includes a number conversion chart, binary arithmetic from conversions to divisions, and a discussion of octal and hexadecimal numbers. A good background to read technical literature and computer equipment specifications. \$6.95.*

computer games

● **WHAT TO DO AFTER YOU HIT RETURN** PCC's first book of computer games . . . 48 different computer games you can play in BASIC . . . programs, descriptions, muchly illustrated. Lunar landing, Hammurabi, King, Civel 2, Qubic 5, Taxman, Star Trek, Crash, Market, etc. \$8.00.*

● **SCELBI'S GALAXY GAME FOR THE "6800"** Here's a new twist in computer games by Robert Findley/Raymond Edwards. "Galaxy" pits the operator of a spaceship against alien craft, as well as such variables as speed, time, and ammunition. No two games are the same! \$14.95.*

● **BASIC COMPUTER GAMES** Okay, so once you get your computer up and running in

BASIC, then what? Then you need some programs in BASIC, that's what. This book has 101 games for you, from very simple to real buggers. You get the games, a description of the games, the listing to put in your computer and a sample run to show you how they work. Fun. Any one game will be worth more than the price of the book for the fun you and your family will have with it. \$7.50.*

● **SCELBI'S FIRST BOOK OF COMPUTER GAMES** Need a game for your 8008 or 8080 microprocessor? Has three popular games, "Space Capture," "Hexpawn," and "Hangman." Complete flowcharts, logic description, program listing, and instructions are provided. A must for the game freak! \$14.95.*

* Use the order card in the back of this magazine or itemize your order on a separate piece of paper and mail to: Kilobaud Book Department • Peterborough NH 03458. Be sure to include check or detailed credit card information. For orders under \$10.00, add \$1.00 shipping and handling.

software • programming

● **DISCOVERING BASIC — A Problem Solving Approach** by Robert E. Smith deals with progressively more complex problems which allow the reader to discover the vocabulary of BASIC language as he develops skill and confidence in putting it to work. Clear and concise explanations. Problems used cover a wide range of interests — insurance, geometry, puzzles, economics, etc. \$6.85.*

● **BASIC New 2nd Edition.** by Bob Albrecht. Self-teaching guide to the computer language you will need to know for use with your microcomputer. This is one of the easiest ways to learn computer programming. \$4.95.*

● **A QUICK LOOK AT BASIC** by Donald D. Spencer. A perfect reference for the beginning programmer. Assumes that the reader has no previous programming experience and is a self-teaching guide for the individual desiring to learn the fundamentals of BASIC. \$4.95.*

● **MY COMPUTER LIKES ME ... WHEN I SPEAK BASIC** An introduction to BASIC ... simple enough for your kids. If you want to teach BASIC to anyone quickly, this book is the way to go. \$2.00.*

● **FUN WITH COMPUTERS AND BASIC** by Donald D. Spencer, contains an easy-to-understand explanation of the BASIC Programming Language and is intended for persons who have had no previous exposure to computer programming. Over half the book is devoted to problems using games, puzzles, and mathematical recreations. A superior book for self-teaching and learning computer programming. \$6.95.*

● **SIXTY CHALLENGING PROBLEMS WITH BASIC SOLUTIONS** by Donald Spencer, provides the serious student of BASIC programming with interesting problems and solutions. No knowledge of math above algebra required. Includes a number of game programs, as well as programs for financial interest, conversions and numeric manipulations. \$6.95.*

● **THE SECRET GUIDE TO COMPUTERS** Parts 1, 2, and 3 by Russ Walter. **Part One** describes computers in general, and after reading for ten minutes you will be writing simple BASIC programs! **Part Two** discusses computer applications. It's one thing to master the syntax of a language such as BASIC and another to solve problems using the new tool. **Part Three** describes programming languages. Ever heard of APL and QLISP? BASIC is not the only language used to program computers. 7th Edition. Part I - \$2.75*; Part II - \$2.50*; Part III - \$3.50.*

● **SOME COMMON BASIC PROGRAMS** published by Adam Osborne & Associates, Inc. Perfect for non-technical computerists requiring ready-to-use programs. Business programs, plus miscellaneous programs. Invaluable for the user who is not an experienced programmer. All will operate in the stand-alone mode. \$7.50 paperback.*

● **Scientific Research Instruments' BASIC SOFTWARE LIBRARY** is a complete do-it-yourself kit. Written in everybody's BASIC immediately executable in ANY computer with at least 4K, no other peripherals needed. Vol. I contains business and recreational programs and is 300 pages. Vol. II is 260 pages and contains math, engineering, sta-

istics and plotting programs. Vol. III contains money managing, advanced business programs such as billing, A/R, inventory, payroll, etc. Vol. IV contains general purpose programs like loans, rates, retirement, plus games: Poker, Enterprise (take charge while Capt. Kirk is away), Football and more! Vol. V is filled with experimenter's programs including games, pictures and misc. problems like "logic." Vols. I & II \$24.95,* Vol. III \$39.95,* Vol. IV & V \$9.95 each,* Vol. VI \$49.95,* Vol. VII \$39.95.*

● **MICROPROCESSOR PROGRAMMING for Computer Hobbyists** by Neill Graham is for the hobbyist interested in intermediate and advanced techniques of programming and data structuring. Written to take up where the computer manufacturers' instruction manuals and the introductory programming language texts leave off. \$8.95.*

● **ADVANCED BASIC — Applications and Problems** by James Coan is for those who want to extend their expertise with BASIC. Offers advanced techniques and applications. \$7.95.*

● **8080 PROGRAMMING FOR LOGIC DESIGN** Ideal reference for an in-depth understanding of the 8080 processor. Application-oriented and the 8080 is discussed in light of replacing conventional, hard-wired logic. Practical design considerations are provided for the implementation of an 8080-based control system. \$7.50.*

● **8080 SOFTWARE GOURMET GUIDE AND COOKBOOK** If you have been spending too much time developing simple routines for your 8080, try this new book by Scelbi Computing and Robert Findley. Describes sorting, searching, and many other routines for the 8080 user. \$9.95.*

● **6800 PROGRAMMING FOR LOGIC DESIGN** Oriented toward the industrial user, this book describes the process by which conventional logic can be replaced by a 6800 microprocessor. Provides practical information that allows an experimenter to design a complete micro control system for the "ground up." \$7.50.*

● **6800 SOFTWARE GOURMET GUIDE & COOKBOOK** If you have been spending too much time developing routines for your 6800 microprocessor, try the new book by Scelbi Computing and Robert Findley. Describes sorting, searching, and many other routines for the 6800 user. \$9.95.*

● **FORTRAN PROGRAMMING** by Donald Spencer. FORTRAN was designed for complex numeric calculations; and possesses extended I/O capability. It is easily learned, as it is an English-like computer language. \$7.50.*

● **FORTRAN WORKBOOK** by Donald Spencer. Provides practical examples and problems to solve. Flowcharting is also discussed. Almost all micros support BASIC — it won't be long before FORTRAN is commonplace. \$3.95.*

● **CHEMISTRY WITH A COMPUTER** by Paul A. Cauchon, contains a collection of tutorial, simulation and problem-generation computer programs. Usable with almost any chemistry course in the high school or college level. \$9.95.*

*Use the order card in the back of this magazine or itemize your order on a separate piece of paper and mail to: Kilobaud Book Department • Peterborough NH 03458. Be sure to include check or detailed credit card information. For orders under \$10.00, add \$1.00 shipping and handling.

Kilobaud Book Department

hardware

● **MICROPROCESSOR INTERFACING TECHNIQUES** by Austin Lesea & Rodney Zaks will teach you how to interconnect a complete system and interface it to all the usual peripherals. It covers hardware and software skills and techniques, including the use and design of model buses such as the IEEE 488 or \$100. \$9.95.*

● **TTL COOKBOOK** by Donald Lancaster. Explains what TTL is, how it works, and how to use it. Discusses practical applications, such as a digital counter and display system, events counter, electronic stopwatch, digital voltmeter, and a digital tachometer. \$8.95.*

● **CMOS COOKBOOK** by Don Lancaster. Details the application of CMOS, the low power logic family suitable for most applications presently dominated by TTL. Required reading for every serious digital experimenter! \$9.95.*

● **TVT COOKBOOK** by Don Lancaster, describes the use of a standard television receiver as a microprocessor CRT terminal. Explains and describes character generation, cursor control and interface information in typical, easy-to-understand Lancaster style. \$9.95.*

● **BUILD-IT BOOK OF DIGITAL ELECTRONIC TIMEPIECES** by Robert Haviland is a data-packed guide to building every time-keeping device you can imagine: rugged ship-board clocks, second-splitting digital IC chronometers, decorator digital clocks, a precision timer, a frequency-period meter, a tide and moon clock, an automatic alarm setter, etc. Including full-size printed circuit board layouts. \$6.95.*

● **THE "COMPUTATOR" BOOK** — Building Super Calculators & Minicomputer Hardware with Calculator Chips by R. P. Haviland, provides ideas, design info and printed circuit boards for calculator chip projects, measure time, tie in with a Teletype to create a virtually infinite memory system, and countless other functions. \$7.95.*

TEST EQUIPMENT LIBRARY

● **VOL I COMPONENT TESTERS** Build your own test equipment and save a bundle (and have a lot of fun). Volume I of the 73 Test Equipment Library shows you how to build and use transistor testers (8 of 'em), three diodes testers, 3 IC testers, 9 voltmeters and VTVMs, 8 ohmmeter, 3 inductance meters, and a raft of other gadgets for checking temperature, crystals, Q, etc. \$4.95.*

● **VOL II AUDIO FREQUENCY TESTERS** If you're into audio such as digital cassette recording, RTTY, Baudot vs ASCII, SSTV, SSB, Touchtone or even hi-fi you'll want to have this book full of home built test equipment projects. Volume II \$4.95.*

● **VOL III RADIO FREQUENCY TESTERS** This is of more interest to hams and CBers: test equipment you can build for checking out transmitters and receivers, signal generators, noise generators, crystal calibrators, GDOs, dummy loads. \$4.95.*

● **VOL. IV IC TEST EQUIPMENT** Become a trouble-shooting wizard. All you need to know about pulse, audio and sync generators, frequency counters, digital component testers, logic probes and more! Plus a cumulative index for all four volumes of the 73 Test Equipment Library. \$4.95.*

general

● **COMPUTER DICTIONARY** by Donald D. Spencer. Defines words and acronyms used by computerists in a clear, easy to understand style. This reference is a must for the individual getting started in the world of microcomputers. \$5.95.*

● **MICROCOMPUTER DICTIONARY** This microcomputer dictionary fills the need to become quickly acquainted with the terminology and nomenclature of the revolution in computers. There is also a comprehensive electronics/computer abbreviations and acronyms section. \$15.95*

● **THE UNDERGROUND BUYING GUIDE** Here is a handy guide for the electronics enthusiast. Over 600 sources of equipment and literature are provided. Cross-referenced for ease of use. Electronic publishing houses are also listed. \$5.95 each.*

● **1976 PERIODICAL GUIDE FOR COMPUTERISTS** is a 20-page book which indexes over 1,000 personal computing articles for the entire year of 1976 from Byte, Creative Computing, Digital Design, Dr. Dobbs Journal, EDN, Electronic Design, Electronics, Interface Age, Microtrek, Peoples Computer Company, Popular Electronics, QST, Radio Electronics, SCCS Interface and 73 Amateur Radio. Price \$3.00.* New January — June 1977 Edition (includes Kilobaud) — \$3.00.*

● **TYCHON'S 8080 OCTAL CODE CARD** Slide rule-like aid for programming and debugging 8080 software contains all the mnemonics and corresponding octal codes. Also available, Tychon's 8080 Hex Code Card, same as above only has hex codes instead of octal. \$3.00 each.*

amateur radio books

● **NOVICE STUDY GUIDE** The most complete Novice study guide available. It is brand new. This is not only invaluable for anyone wanting to get started in amateur radio, but also it is about the only really simple book on the fundamentals of electricity and electronics. \$4.95.*

● **GENERAL CLASS STUDY GUIDE** Takes over on theory where the Novice book leaves off. You'll need to know the electronic theory in this to work with computers and you'll not find an easier place to get the information. \$5.95.*

● **SSTV HANDBOOK** This excellent book tells all about it, from its history and basics to the present state-of-the-art techniques. Hard-bound \$7.* Softbound \$5.*

● **VHF ANTENNA HANDBOOK** This new handbook details the theory, design and construction of hundreds of different VHF and UHF antennas. Packed with fabulous antenna projects you can build. \$4.95.*

● **WEATHER SATELLITE HANDBOOK** Simple equipment and methods for getting good pictures from the weather satellite. Dr. Taggart WB8DQT \$4.95.*

● **THE NEW RTTY HANDBOOK** is a brand new 1977 edition and the only up-to-date RTTY book available. The state-of-the-art has been changing radically and has made all previous RTTY books obsolete. It has the latest circuits, great for the newcomer and the expert alike. \$5.95.*

* Use the order card in the back of this magazine or itemize your order on a separate piece of paper and mail to: Kilobaud Book Department • Peterborough NH 03458. Be sure to include check or detailed credit card information. For orders under \$10.00, add \$1.00 shipping and handling.

NEW ADDITIONS TO THE KB BOOK NOOK

● **MICROPROCESSORS FROM CHIPS TO SYSTEMS** by Rodney Zaks is a complete and detailed introduction to microprocessors and microcomputer systems. No preliminary knowledge of computers or microprocessors is required to read this book, although a basic engineering knowledge is naturally an advantage. Intended for all wishing to understand the concepts, techniques and components of microprocessors in a short time. \$9.95.*

● **YOUR OWN COMPUTER** by M. Waite and M. Pardee. The personal computer has been touted as the next consumer product. But most individuals still wonder why. Much technical material has been written but there is little material for the average individual without an extensive background in electronics. This book removes the stigma of complexity that surrounds the computer and has succeeded in providing a simple easy-to-understand guide to these units. \$1.95.*

● **BEGINNING BASIC** by Dr. Paul Chirlian provides a really basic BASIC that covers all the topics in simple, easy-to-understand language. Nothing is left out, everything is presented in clear, step-by-step fashion. This book will make a good BASIC programmer of any reader. \$9.95.*

● **THE COMPUTER QUIZ BOOK** by Donald D. Spencer is written for readers who would like to test themselves on basic computer concepts. It may be used effectively by students, teachers, laymen, programmers, personal computer users, or anyone else interested in checking their knowledge of computer concepts. \$5.95.*

● **PAYROLL WITH COST ACCOUNTING - IN BASIC** by L. Poole & M. Borchers includes program listings with remarks, descriptions, discussion of the principle behind each program, file layouts, and a complete user's manual with step-by-step instructions, flow charts, and simple reports and CRT displays. Payroll and cost accounting features include separate payrolls for up to 10 companies, time-tested interactive data entry, easy correction of data entry errors, job costing (labor distribution), check printing with full deduction and pay detail, and 16 different printed reports, including W-2 and 941. Price only \$12.50.*

● **HOW TO BUY & USE MINICOMPUTERS AND MICROCOMPUTERS** by Wm. Barden, Jr. This book discusses these smaller brethren of computers and shows how the reader can become a part of the revolution - how he can own and use a functioning computer system in his home to do a variety of practical or recreational tasks. \$9.95.*

● **Microprocessor Lexicon - Acronyms and Definitions** Compiled by the staff of SYBEX is a convenient reference in pocket size format. Sections include acronyms and definitions; part numbers and their definitions; S-100 signals; RS232 signals; IEEE 499 signals; microcomputer and microprocessors; JETDS summary (military) and a code conversion table \$2.95.*

● **HOW TO PROGRAM MICROCOMPUTERS** by Wm. Barden, Jr. Here is a guide to assembly language programming of the Intel 8080, Motorola MC6800, and MOS Technology MCS6502 microprocessors. It is written especially for beginning programmers with hobbyist microcomputers based on one of these three chips. The topics covered range from data manipulations at the bit level up to data handling of tables and lists, and from simple adds and subtracts up to floating-point operations. \$8.95.*

● **TAKE A CHANCE WITH YOUR CALCULATOR** Lennart Rade wrote this book to help you to discover the world of probability with your programmable calculator. You will need NO previous experience either in probability theory or in programming to learn both from this book. \$8.95.*

● **A STEP BY STEP INTRODUCTION TO 8080 MICROPROCESSOR SYSTEMS** by D.L. Cohn & J.L. Melsa. This microprocessor book is written for people who don't know anything about microprocessors but who wish they did. The step-by-step presentation does not require any computer or electronics background, so anyone who is interested can follow it. However, the book is not only intended for beginners. Engineers and technicians who are familiar with electronics will find the software descriptions valuable in updating their skills. Computer professionals will find the detailed treatment of the 8080 architecture and instruction set useful. Price \$7.95.*

● **YOUR HOME COMPUTER** by James White, is an introduction to the world of personal microcomputing. Written in clear and understandable language, this book tells you everything you want to know about home computing and gives the computer novice a painless introduction to microcomputer technology and terminology, beginning with what computers are and how they work. This basic book requires no prior knowledge or experience in electronics or computing.

It provides information about home computer kits, guidelines for selecting and building your own microcomputer, how to use your home computer and what you can do with it, lists of computer stores, clubs, periodicals, and answers to many more of your questions about microcomputers and the jargon surrounding the personal computing scene today. \$6.00.*

● **INSTANT BASIC** by Jerald R. Brown. For the personal computer enthusiast or the user of DEC's BASIC PLUS language, here, finally, is a new book to teach you BASIC. It teaches BASIC to beginners using interesting programming ideas and applications that will be easily understood by the home computer programmer. BASIC PLUS users know that the two languages are very similar, so this book can be used by them as well. This is an "active participation" workbook, designed to be used with your home computer so you can learn by doing! Ideas are slowly introduced in a nonmathematical context so the beginner can quickly learn good programming techniques. \$6.00.*

● **PROGRAMMING IN PASCAL** by Peter Grogono. The computer programming language PASCAL was the first language to embody in a coherent way the concepts of structured programming which had been defined by Edsger Dijkstra and C.A.R. Hoare. As such it is a landmark in the development of programming languages. PASCAL was developed by Niklaus Wirth in Zurich; it is derived from the language ALGOL 60 but is more powerful and easier to use. PASCAL is now widely accepted as a useful language that can be efficiently implemented, and as an excellent teaching tool. This book is intended for people who want to write programs in PASCAL. It does not assume knowledge of any other programming language and it is therefore suitable for an introductory course. \$9.95.*

* Use the order card in the back of this magazine or itemize your order on a separate piece of paper and mail to: Kilobaud Book Department ● Peterborough NH 03458. Be sure to include check or detailed credit card information. For orders under \$10.00, add \$1.00 shipping and handling.

COMPUTER MAILING LIST

Completely re-written and updated to include dealers, clubs, publications, and manufacturers. (It's the one we use for our mailings and we update it daily.) The list has over 2000 names painstakingly gathered from manufacturers, magazine ads, new product releases, hobby computer shows, and direct mail. You can buy this list printed on self-sticking labels for only \$50.

PETERBOROUGH NH 03458

1977 kilobaud Binders

Keep your Kilobauds from being lost or damaged in these handsomely appointed binders with rich blue covers and gold lettering. Each binder holds 12 issues, making an EXCELLENT REFERENCE HANDBOOK. Several binders form a quality library you can be proud of.

Order yours today . . . only \$6.50 each . . . 2 for \$12.00.

Use the order card in the back of this magazine or itemize your order on a separate piece of paper and mail to:
Kilobaud Binders Peterborough NH 03458
Be sure to include check or detailed credit card information
Add \$1.00 shipping & handling charge for each order.

SEND FOR THESE GREAT BOOKS TODAY!

● **HOBBY COMPUTERS ARE HERE** If you (or a friend) want to come up to speed on how computers work . . . hardware and software . . . this is an excellent book. It starts with the fundamentals and explains the circuits, the basics of programming, along with a couple of TVT construction projects, ASCII-Baudot, etc. This book has the highest recommendations as a teaching aid for newcomers. \$4.95

● **THE NEW HOBBY COMPUTERS!** This book takes it from where "Hobby Computers Are Here" leaves off, with chapters on Large Scale Integration, how to choose a microprocessor chip, an introduction to programming, low cost I/O for a computer, computer arithmetic, checking memory boards, a Baudot monitor/editor system, an audible logic probe for finding those tough problems, a ham's computer, a computer QSO machine . . . and much, much more! Everything of interest is there in one volume. Don't miss this tremendous value! Only \$4.95

Have your credit card handy and call toll-free 800-258-5473, or use the card in the back of this magazine and send your check to:

KILOBAUD Book Dept. • Peterborough, NH 03458
(Be sure to include \$1.00 per order for shipping & handling.)

MOVING?

Let us know 8 weeks in advance so that you won't miss a single issue of *Kilobaud*.

Attach old label where indicated and print new address in space provided. Also include your mailing label whenever you write concerning your subscription. It helps us serve you promptly. Write to:

● KILOBAUD ● PETERBOROUGH NH 03458 ●

we're looking for someone serious about personal computing!

8-bit? 16-bit? The better of the two? The question is elemental – hardly worth consideration. What matters is your "machine's" CPU, its "architecture," and most importantly its instruction set. That's where the power is and that's exactly why we're telling you about the KD11-F.

The KD11-F is the CPU we chose for the Heath H11. It's built by DEC, is the same CPU that's the cornerstone of the popular LSI-11 family, and is the main reason our 16-bit is the most powerful 16-bit in its price class! Bells and whistles? Hardly!

Fact: The KD11-F has eight registers. Six of which are general-purpose and non-dedicated! That alone means virtually unlimited programmer flexibility!

Fact: Most computers in the 16-bit class use three types of instructions (memory reference, operate or accumulator control, and I/O instructions). The KD11-F accomplishes all data manipulations with a single set of instructions – which results in very efficient operation!

Fact: The KD11-F's PDP-11 instruction set has the most

powerful repertoire of instructions of any computer in its price class.

What it all boils down to is that the Heathkit H11 gives you fantastic flexibility, unparalleled high-speed program execution, and unmatched performance!

Our H11 CPU isn't for everyone. It's for someone serious about computing... someone like you!

Heathkit Computers

the world's most powerful microcomputer comes home

Computer hobbyists have always wanted the power and speed of professional machines. But they've had to settle for less. Professional machines were too expensive. Not anymore. Now there's the Heathkit H11.

Professional performance, kit price. The H11 uses Digital Equipment Corporation's 16-bit LSI-11 CPU. Exactly the same CPU found in the famous DEC PDP-11—probably the most popular commercial and industrial computer in the world. So now a low-cost kit gives you the speed, power and throughput of the world's most popular professional computer.

Software and support. As an H11 owner, you have access to an incredible range of software—editor, relocatable assembler, linker, absolute loader, debug program, I/O executive program, dump routines, BASIC and FOCAL. And, by joining the DEC user's group (DECUS), you can have access to one of the largest software libraries in the world. And there's more to come. Much more.

Of course, the H11 executes the powerful PDP 11/40 instruction set which includes over 400 commands. And the fully assembled KD-11F CPU board includes 4K x 16 bits of memory. The backplane accepts up to six additional modules (memory, serial and parallel I/O, etc.)

Heath will soon introduce a dual floppy with a disk operating system to take

full advantage of the H11's power. And the H11 is fully compatible with all DEC LSI-11 accessories.

Heath documentation is second to none. You get illustrated step-by-step instructions on how to build the kit, thorough explanations of the software and comprehensive operating instructions. If you want to see for yourself, we'll send you the entire manual set (#HM-1100) for just \$25. And you can apply the cost to the price of the computer.

With the Heathkit H11, you can enjoy power, speed, versatility and potential no 8-bit machine can match. And the H11 costs little more than lesser computers—just \$1295.*

Don't settle for less than the best. A close look in the latest Heathkit catalog will convince you that the H11 is the best home computer you can buy.

DEC, DECUS, PDP and FOCAL are registered trademarks of Digital Equipment Corp.

*Mail order, FOB, Benton Harbor, Michigan. Retail price slightly higher.

HAPPY INTERTUBE™

784 Reasons to Celebrate

The party's over for all dumb terminals and a lot of smart ones too. But, at \$784 (quantity one), the party's just beginning for Intertec's INTERTUBE.

Standard features to celebrate include a full 24 line by 80 character display, 128 upper and lower case ASCII characters, reverse video, complete cursor addressing and control, an 18 key numeric key pad, special function keys, blinking, a self-test mode, protected fields, line and/or character editing capabilities, eleven special graphic symbols and an RS-232 printer port.

You'll discover even more reasons to celebrate when you sit down in front of an INTERTUBE. Our special AccuDot focusing technique produces crisp, sharp characters on a non-glare screen. INTERTUBE's Z-80 processor assures extreme flexibility with operator oriented features to boost the efficiency of both software and programmers. And, if service is ever required, INTERTUBE's well-designed modular component layout insures quick service by a nationwide factory-trained network providing more than 250 local dealer and service center outlets.

INTERTUBE's combination of price and performance can satisfy your requirements whether it be a sophisticated data entry application or a simple inquiry/response environment. So, there's really no reason to think "dumb" when you can afford to be so smart!

There's an INTERTUBE celebration going on near you. Contact us at one of the numbers below for the name and location of the nearest party. We'll be surprised if you don't come (BYOB). Happy INTERTUBE!
